Measure DC voltage on top terminal of XMTR GAIN control in _CAL_ position as control is varied from CCW to CW.

73, Garey - K4OAH
Glen Allen, VA

Interesting. Only 8 watts carrier, even at full CW of xmit gain pot, but I do get a full power ssb emission when modulating. Side band sw is set to x. Btw I made a ssb contact with good report. X-CW/tune is stuck at 140 watts out

I read the impedance of the EV RE-320 is 150 ohms -- isn't that a little low for the TR7? How do you get it to match, and how's it sound, Jim?

Subject: Re: [DrakeRadio] Drake Microphones

There's an amusing thought.

I actually know a guy who does repaints on pro-audio mics. He used to work in our Electro-Voice service area. I was thinking of having him do a black RE-20 for me, but then I stumbled into some RE-320 parts and built my own. He has one of my orignal gray +3s that he re-painted in a sort of hammertone gray for me. I need to get that from him and re-assemble it. I'd like to have him re-do my "Lafayette Range Boost" +3B, but I would need a good way to reproduce the markings for the level control.

OK, that's normal AM.

Do the voltage measurement at the top of R74 in CAL position.

.003 - 84.9. Out of curiosity I opened connection between R75 and R74. No change, other than loss of side tone. Checked R75 -- good.

With R74 divorced from +VDC and still full output, would that not point to an issue with balanced modulator? But why is the rig working properly in ssb mode? Really appreciate your time and help.

What does voltage at the top of R74 do in CW. I'm suspecting a shorted coax now.

73, Garey - K4OAH
Glen Allen, VA

Would it hurt to attempt a balanced modulator alignment? I can detune enough with preselector (rf tune) to get IP low enough

Topic: 19235 Message: 19253

In CW MODE?? If so would indicate an open coax. The top of R74 is tied to two diode junctions in series to ground.
Should not get to more than a half volt or so. Measure voltage at the BAL MOD coax.

73, Garey - K4OAH

No I was in cal. In CW voltage drops to 0.16. I'm going to attempt balanced modulator aligned per manual. Don't see what that can hurt. Perhaps those years in the attic...

OK.. Can't hurt.

1. In SSB MODE, the BAL MOD nulls the CAR OSC, and the resulting DSB, suppressed carrier signal output to filters.

2. In CW MODE, a DC current is passed through two of the four diodes in the BAL MOD, severely unbalancing it, allowing
the CAR OSC to pass through at near full level. The CAR OSC frequency is shifted up ~ 1kHz to put it within the LSB
filter passband, to pass through with minimum attentuation.

The 0.16 V you are measuring at the top of R74 in CW is kind of low. The diodes ARE Germanium, but typically the
voltage is around a half volt. Perhaps a shorted diode? The diodes are inside T14, and there have been cases where one
of the diode leads shorts to the inside of the can.

73, Garey - K4OAH
Glen Allen, VA

From: Leon Zebrick
Topic: 19235 Message: 19256

Garey. With the carrier balance control fully ccw and c127 adjusted for null, things are much better, but I'm sure not as they are supposed to be. With plate off resonance, IP is 225 Ma. at minimum gain. That's the worst case now in "Tune". I was expecting a null with the carrier balance control but it brought IP down in a linear fashion - no null. SSB performance seems great with good carrier suppression. I can let this ride. At least I won't hit excessive IP when off resonance and gain fully ccw.

19257. Re: [DrakeRadio] TR4 CW, Excessive Transmit Drive

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-05 21:07:42 UTC
From: Leon Zebrick
Topic: 19235 Message: 19257

I'm thinking shorted diode. But as mentioned, I'll limp along since I apparently compensated with the adjustments, even though one is at its "end". This has been great. And again, the Bogen audio transformer did the trick! Had to hit the tabs on my grinder, but it fits fine. Thank you again.

> Garey. With the carrier balance control fully ccw and c127 adjusted for null, things are much better, but I'm sure not as they are supposed to be. With plate off resonance, IP is 225 Ma. at minimum gain. That's the worst case now in "Tune". I was expecting a null with the carrier balance control but it brought IP down in a linear fashion - no null. SSB performance seems great with good carrier suppression. I can let this ride. At least I won't hit excessive IP when off resonance and gain fully ccw.

Thank you Steve. What do you mean when you say 'make sure it's peaking where it should'? Also, I already have it hooked up to my R4B. When I tried tuning the Xmtr, I had the switch (Xmtr, Rcv, seperate) set to Rcv. Also, the xtal switch is set to norm. I don't have a scope, but a friend has one. The testing may take me some time, but I will do what you describe and post my results later. Thanks again,   John

On Tuesday, March 4, 2014 9:11 PM, Steve Wedge <w1es1982@...> wrote:

John,

First, welcome!

Now - don't assume that the finals are good. If
you're getting a power peak on 15 only, be sure that it's peaking approximately
where it should.

If you have a matching receiver, connect the two
together and see if (1) the receiver can receive signals with the TX in control
of the frequency and (2) if the TX can output using the RX to control the
frequency. The outcome of this will give you a general idea of where the
problem may be.

If you have a scope, check for the carrier oscillator
signal where it connects to the balanced modulator. You have to key the
rig to see this.

The band oscillator should show signals on each band if
you attach the probe to the output of the oscillator where it connects to the
wafer switch.

Finally, the PTO should show output where it enters the
board via the (usually) green and white wire from the PTO.

If the seller was honest and it really was working two
years ago, you do not want to start fiddling with the RF trimmers just
yet. Check for these signals.

Also, make sure that your XTALS switch is set to
NORM.

Subject: [DrakeRadio] Help with T4XB

Just
picked one up on Ebay...supposedly worked 2 years ago, it's been sitting in a closet till I bought it. Seems to be in pretty nice shape, but I can't get it to load up properly on any band, and it only puts out almost 40 watts on 15 meters only...won't load up on any other band. I followed the instructions to a tee, many times. I did set the bias as directed. Im using a dummy load to try it out. One tube was out when I received it, I just plugged it back in, but realize that doesn't mean it's good. They all light up, but that's all I can say. I cleaned all controls and switches with deoxit, and tube sockets. Im trying not to mess with it too much, especially worried about damaging the finals. I'm good with electronics, but have never dug too deep into the Drake units as far as how they're supposed to work (the technical part). Any idea of where to start, what to look for, what to replace? Tube maybe? I don't know where to go from here. Thanks.

OK.. It certainly points to a diode. I would suggest one more test. Check the resistance to ground from the center coax
lead in SSB mode. Then reverse the polarity of the ohmmeter probes and check again. If you have a DMM with a diode
test function, you should measure about two diode junctions to ground in either polarity, and the readings should be
pretty close to each other.

When you load it on 15M, does the RF TUNE peak in the 15M segment of the scale? The PLATE control should dip at about 4
and the LOAD control about the same. What does the Plate meter read when you are getting 40W output?

Thanks for posting the link, Joe. You have saved me the time of looking it up to find out how I did it. I know it's in my notes somewhere, but it's often easier just to look it up online if it's something that I have posted. My notes tend to be pretty messy.

Indeed, both the impedance and output are on the low side for our radios. I have acquired an inexpensive ART "Tube MP" pro-audio mic preamp to use with the various pro mics that I want to give a spin on the air. I have more than just the RE-20 and RE-320 on hand, and this box supports phantom power for condensers also. It's XLR input for the pro mics with XLR and unbalanced output.

I have the cables made up for the audio connections, but I haven't actually put it on the air yet. I need to rig a PTT switch, and I haven't decided yet how I want to do that.

The black RE-20 and the RE-320 look really cool in a 309 shock mount....

The RE-320 is essentially an RE-27 in an RE-20 casing with built-in EQ options set up to facilitate kick drum usage as the main bullet point, but they seem to have developed a following for vocal work as well.

19264. TR-5 Restoration Starts

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-05 22:29:02 UTC
From: <chrismortlock1@...>
Topic: 19264 Message: 19264

Hi All,

Have posted some photo's of the 'barn find' TR-5 in the photo's section.

Here's where I've got to, PS-75 is functional (brought up to voltage on a variac) with no smoke. TR-5 powers up, digital display works on all bands, No audio Output (as per fault in a letter written to Drake buy the previous owner - see my previous post).

Injected Audio tone into the volume control and audio is heard and can be varied.

Checked PTO output - working and seems pretty stable :)
XTAL Osc working with output on all band postions.
BFO osc - no output regardles of mode switch position.

So far Ive checked the obvious bits such as voltage into the board - all OK, check the voltage changes when the mode switch is moved - it does. Checked basic boas voltages on the semiconductors - all seems OK. At one point I think the oscillator started when I was probing the board with a scope, so maybe a dry joint - or perhaps the oscillaotr or crystal is a little lazy ? or perhaps a capacitor is out of spec ?

Thinking that I might take the board out and run it out of the rig with bench power supply and see if I| can get it started.

Anyone have any previous problems with the BFO boards ? any tios or tricks ?

Making progress and have isolated the fault so making good progress :)

Thanks and 73's
Chris

I'd be very interested to hear these different mics when you get them airborne.

I'd be interested if a studio mic could improve my audio, but I'm not interested to go the route of th so-called "hi-fi" eSSB-ers with their processing gear that goes between mic and radio. Have you heard these guys? They have a vocabulary all their own, reminiscent of wine experts to describe characteristics of their sound (e.g., "wet").

I'm not convinced all that gear enhances intelligibility or even listenability (especially when signals are on the weak side of 5-9).

Date: 2014-03-06 00:40:19 UTC
From: Steve Wedge
Topic: 19217 Message: 19267

If you were getting output on 15, be sire the pointer is near the area that corresponds to 15m. There are some positions where you could get output that is not where you would expect. A well known area is having the bandswitch at 40 and the rf tune in the 80m area. It amplifies the carrier oscillator at 5645 MHz.

If you have both turned on, can you get signals in the rx using the tx to control?

Steve Wedge, W1ES/4

> Just picked one up on Ebay...supposedly worked 2 years ago, it's been sitting in a closet till I bought it. Seems to be in pretty nice shape, but I can't get it to load up properly on any band, and it only puts out almost 40 watts on 15 meters only...won't load up on any other band. I followed the instructions to a tee, many times. I did set the bias as directed. Im using a dummy load to try it out. One tube was out when I received it, I just plugged it back in, but realize that doesn't mean it's good. They all light up, but that's all I can say. I cleaned all controls and switches with deoxit, and tube sockets. Im trying not to mess with it too much, especially worried about damaging the finals. I'm good with electronics, but have never dug too deep into the Drake units as far as how they're supposed to work (the technical part). Any idea of where to start, what to look for, what to replace? Tube maybe? I don't know where to go from here. Thanks. John KD2BLY

As I recall those diodes have relatively thin, stiff legs that are easy to break if bent more than a couple of times. It may have been accidental and could have even been unnoticed at the time.

I've heard of the hi-fi guys and marveled at the money they spend on audio chains, but I've never given them a listen. I suppose I should, I could use them for my A-B comparisons of modified vs. unmodified R-7s.

I'm with you, I'm not excited about going to the lengths that they do. Going for natural sound with low distortion in the chain is a good thing, and I may take some of my RX audio improvements to the TX exciter board the next time around. But throwing thousands of dollars at an external audio chain is probably a game for those that are bad at math and have the pocket change to spare.

Even using a preamp with the pro mics kind of goes against my grain, but in this case it is a necessary evil. I chose the Tube MP because they seem to have a decent reputation for sonic quality, they can be found inexpensively on the auction site, and to be honest because it has a tube in it.

What I expect is that the pro mics will have a very clean, accurate, natural sound, but will lack some of the "punch" that the ceramic communications mics have.

The HamManuals CD has an R-7 PDF that is of decent quality. It has a hyperlinked table of contents, which a lot of the electronic manual peddlers don't bother with.

http://www.hamanuals.com/Series1.html

You could probably purchase a decent repro from the usual sources. I imagine that most of the original manuals out there are still with a radio and won't get separated.

Subject: Re: [DrakeRadio] Drake Microphones

I'd be very interested to hear these different mics when you
get them airborne.

I'd be interested if a studio mic could improve my audio,
but I'm not interested to go the route of th so-called
"hi-fi" eSSB-ers with their processing gear that goes
between mic and radio. Have you heard these guys? They have
a vocabulary all their own, reminiscent of wine experts to
describe characteristics of their sound (e.g., "wet").

I'm not convinced all that gear enhances intelligibility or
even listenability (especially when signals are on the weak
side of 5-9).

Brenton
VE6 IE

Oh, golly, I made my living at this for a while but
can't hear worth a spit now. The standard impedance for
"professional" microphones is 150 ohms. In the past
impedances from around 30 ohms to about 600 ohms could be
found but most centered around about 50 ohms and about 200
ohms. The impedance is the source impedance of the
microphone. The mics are intended to work into a
substantially higher impedance, ideally infinite but in
practice tube pre-amps with input transformers presented
about 5000 ohms at the input when connected for about 200
ohms. Nearly all pro mics are balanced output. These are
rare and most condenser microphones requiring external power
supplies use "phantom" voltages running between the balanced
audio and shield. For generator microphones running them
unbalanced makes no difference in the sound. In fact,
Western Electric used to build their consoles for unbalanced
50 ohms but that was because it was cheaper than providing
the switching necessary for balanced input.
The reason for the high load impedance is that
microphones are _voltage_ sources, not power sources, so the
best signal to noise is gotten from a high load impedance
which does not lower the output voltage. Also, some types
of microphones, notably ribbon and some types of directional

moving coil mics do not have constant impedance. They have a definite low-frequency resonance with attendant rise in impedance, if run into a matching load the low end will roll off. Condenser and electret microphones have associated electronics which eliminates any effects of load from the pre-amp.
Now, most ham transmitters, especially filter type SSB transmitters, have very narrow audio pass bands, typically from about 300 to about 3000 hz. The roll off beyond this range is quite steep. So, what difference are you going to hear if you use a high quality recording microphone with response from perhaps 30hz to 15Khz? In fact, I have tried this with my T4XB using a high quality input matching transformer. The result is that I get the best reports from an Electro-Voice 665, a middle quality cardioid mic. I've tried a couple of classic microphones, for instance, an RCA 77D and a Western Electric 639A (genuine, not an Altec clone) the EV mic got better results. Modern communications mics are mostly of three types, moving coil, electret, or magnetic of some sort such as variable reluctance. The latter are simple mechanically and cheap to make. They are also very rugged. Most of these microphones have anything but flat response, usually having a low frequency roll-off and a peak at about 3khz. I think the peak can be too much as in the famous D-104 which I have always found unpleasant sounding. If you manage to find a Neumann U-67 (an old favorite) I can think of better uses than on a ham rig.
FWIW, when I could hear and did custom recording I avoided moving coil mics although I did use an EV-666 for kick drum (might use an RE-20 now).
BTW, I am _very_ skeptical of some of the claims by the audio crowd about what they can hear.
Heigh-ho and off to the land of sweet dreams.

19273. R7A AGC Problem

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-06 07:11:28 UTC
From: <w7apm@...>
Topic: 19273 Message: 19273

No AGC in slow position or s-meter action, rf gain control does not affect s-meter. Seems to operate the same in AGC off and AGC slow. Have another working R7 and tried swapping IF/AGC boards with no success.
Switches seem to be functioning normally. I do have AGC in medium and fast positions and s-meter action. Capacitors and Resistors on main board that determine slow AGC time constant measure OK for capacity, Could the polarity be backwards causing the problem?.

Any Ideas?

Thanks!
Marty

Either C1 or C2 on the main board is shorted or
the wiring from the fast agc switch that goes to
R17 or R18 is shorted to ground. This would kill
the agc voltage and cause the problem that you describe.

Thanks Joe for the thoughts

C1 and C2 both check in spec. I wonder about a possible wiring error to the IF/AGC board from the switches too. My downloaded service manual detail isn't very good and I can't read the connections between the switches and the IF/AGC Board

Guys and gals,

i posted a couple of photos of the amp keying interface for the group.

It's a no hole installation. Optical coupling from the radio to the amp. Instead of seeing 30+ volts at 50-100 ma current, the radio will only see 12 v at 4 ma.

Hi Joe, Thanks, I've the documentation for it, but when I've checked (re-read) it, it appears to be for the R4-C receiver and unless its compatible with the TR-5 (is it?) it wouldn't be installed. My guess is that the Silent Key perhaps had other Drake kit (I did get a power meter from the family selling it as well), and maybe he got rid of it but kept the info - guess I'll never know. They did say they would call me if the found any more of 'this sort of stuff' so you never know !

UPDATE.

As per previous post, I decided to remove the BFO Board to aid testing. Applied 10V and 10V Switching to emulate the mode switch. All pin diodes functioned correctly. Checked voltages as per the manual, again all seemed to be correct, so a little puzzling :(

Thought the crystal might not be working - I have xtal problems with Ten Tec quite regularly and so built a small circuit from the GQRP club. Tested it and it started first time and was reliable, so no problem there :)

Rechecked again the bias around the transistors and FET, again seemed OK, the FET might have been slightly high so decided to take the old one out and see if I had a FET suitable in my 'stock',

The only one I had was a J310 which has the Drain and Gate is reversed (which actually fits the pinout on the board better!) - decided to swap it anyway ahead of ordering a the correct equivalent.

And the result was - success :) - I've attached three extra pictures of the board, it on the test bench and a scope and frequency counter.

Put the board back in the radio and sat down to have a very pleasant time listening to 7Mhz and 18Mhz (which was wide open to the states). Still getting used to the 'reverse' tuning, seems to work quite well, I'm impressed with it, and I haven't aligned it or checked it further - just enjoying it at the moment !!

So that seems to have sorted the primary fault, now to check it more fully and onto the transmitter and a complete alignment and then a really good clean.

more updates when I get the chance to give it more time :)

I tend to agree. I think a lot of it is psychological - you spent $500 on pure gold unobtainium-insulated dilithium-core speaker wire, so of course it sounds better. You wouldn't spend your money foolishly, would you? I know a guy who is generally very good with audio (he manufactured high end speakers and tube amps for a while) but who insists gold-plated "medical grade" 120v wall outlets make a difference in sound. Who knew the guy was bad at math?

OTOH, I do believe that the cumulative effects of replacing components with higer quality or better suited parts can make noticable differences under some circumstances.

This is probably off topic. I think you are right
about psychology. I think whatever the audioperson hears is
attributed to whatever they changed last and they _expect_
to hear something. High Fidelity as a hobby began a very
long time ago even pre-WW-2 although most of those working
with high-quality audio at the time were pros. However,
about the late 1940s a lot of changes happened perhaps
beginning with the Lp record and tape recording along with a
couple of disc cutters of much better quality than most
avaiable previously. So, one began to have a choice of a

lot of equipment meant for consumers more than professional recorders or broadcasters and it became a sort of horse-power race. Eventually, all parts of the system reached a high degree of perfection so one could still choose equipment but the choice began to make little difference. Nonetheless, people wanted to think they could understand some arcane knowledge that was hidden from others and devise some arrangement that would produce the perfect illusion of... what... music? Maybe but I think a lot of audiofolks listen to equipment and not to music. I can't hear either anymore so am hors de combat as far as arguing equipment is concerned. I suspect many modern day audiofolks would be astonished at what was done in about the late 1930s which what they would consider antiques. For instance, I think one of the transcription service records have been made available on CD. I am drawing a blank on the name of this company but it will come back later. Transcription services were available for broadcast stations because many record companies did not license their records for air play. This company used the Western Electric type 1-A cutter. This was the first cutter to employ motional feedback and was flat out to 15khz with very low distortion. I resulted in a vogue of vertical cut records. The company made its recordings in a large studio with excellent acoustics and the quality is astonishing. This is c.1938 or so.
My point was only that its unlikely that a very high quality microphone will make much difference on a communications channel. Certainly there is nothing wrong with experimenting but the caution is not to spend a lot of money for someting that's not going to do much. OTOH if you do high quality recording and already have some decent microphones by all means give them a try.

Enough of this for now and back to Drake radios.

If you put the very best speaker manufactured in a POS cabinet it will sound like a POS.

If your audio has 2% 2nd harmonic distortion you cannot hear the distortion. If your audio has 2% 3rd harmonic distortion you cannot hear it.

I worked on tape drives for Disney in 64 to 65.

It depends upon the distortion and how used to it you are. Transistor amplifiers got a bad reputation because they were less distorted than vacuum tube amplifiers (the so called harsh or cold sound), or had different distortion (rough sound, hash, etc).

Vacuum tube amplifiers have "warm" or "soft" sound when distorted. People pay good money for these amplifiers a friend of mine spent $1,000 to re-tube his stereo system. They also pay good money for solid state devices that mimic that sound, especially effects units for rock n roll bands.

I spent the 1980's working as a volunteer in a small folk music club and even with my lousy hearing know what live music sounds like. I often have to laugh when people tell me how their system sounds "live", when it does nothing of the sort.

BTW, around 10 years ago, a Taiwanese motherboard manufacturer sold one with a vacuum tube audio preamp on it, to give your computer that "tube sound".

The microphone needs to be suited to the person's voice too. My wife has a high pitched voice and sounds great on D-104's and Japanese HT's. I have a low pitched, kind of rumbly voice and sound horrible on D-104's and Japanese HT's, but sound great with a 10-DA, and LMR radios (Motorola and Chinese).
>
>
Also most hams do not understand how Japanese mobile rigs are designed to be used (microphone in the lap) and over drive them.

With the indulgence of you fellas posting on this thread, I'll be a little less diplomatic than I was in my previous posts. I think I'm preaching to a sympathetic choir. If not, well, as they say, "your mileage may vary."

When I read about these Ham Radio so-called "Hi Fiers", I had to chuckle to myself that they sound to me like they are stuck in a time warp notion of what is "Hi Fi", where more was more. Graphic equalizers were perhaps the garish epitome of the now discredited era. Now a days, in the higher end audio hobby, most people consider less is more. The fewer components interfering in the signal path the better, and for those that must intervene, then better quality is better sound. And irony of ironies, tube amplifiers, like vinyl records, are frequently considered rather more natural sounding.

So when I read about these guys and their mixer board audio components that, for the life of me, resemble a recording studio deployed to shape the signal through equalization and contribute attributes like "moistness" and reverberation to get that "broad cast quality" sound . . . I can only think they are pursuing a goal primarily by adding distortion. And listening to what they accomplish on 14. 178, half of them sound like Silons from Battle Star Galactica. Or Darth Vader from Star Wars. Others sound less distorted and more "broad casty", granted, but that is only when they are 20 over 9. When they are 5-5, their "goofy audio", as I heard one ham call it, their audio is loud enough, but hard to understand.

One of the things that keeps getting mentioned is band width, and the reality that SSB has limited bandwidth. Perhaps "fidelity" isn't to be found in bandwidth any more than in bundles of electronic processing gear, but rather in the simplicity of a microphone can do a better job of tracing the signal, like a good moving coil cartridge track the nuances of the record groove more precisely, quickly and accurately. I don't know if it's the case, but I'm curious.

Just a thought or two to throw in.

At least WRT the RX audio mods to my 7-Line, it's not about the THD. It's about the intermodulation distortion. K9JU set me on this path by noticing the IMD in the TR-7 audio chain. He's a CW op and went to some effort to "clean up" his TR-7. From my own experience, I have some spectrograms that show some interesting before/after effects of the mods in my R-7A. It (the R-7A) never did seem as easy to copy signals on as the TR-7, and it was not a matter of sensitivity. After the first round of changes to my TR-7 it did seem more pleasant to listen to, and I favored it over the R-7A even more so. When I finished the R-7A I almost immediately noticed that signals seemed to stand out above the noise better, and it has become the preferred receiver. After two months of almost daily chasing of W1AW portables that observation has not changed. Under some circumstances it is easier to copy signals on the TR-7, but generally the R-7A is "nicer" most of the time. And this is with the TR-7 patched through the R-7A audio PA as Drake intended so they are using the same speaker.

FWIW, I don't exacly own high-end stereo gear here, nor have I abused my ears with 40 years of ear-splitting music or overly loud headphones. My gear is all off-the-shelf consumer grade, but I can tell the differences between various pieces and I do have my preferences. It seems like a lot of the stuff you find in retail stores these days is almost painful to listen to for any length of time. My first stereo when I was a young ham was the guts out of a console record player found curbside, IIRC two single-ended 50C5 and a preamp tube, with the speakers mounted inside cardboard boxes at each end of the shelf I set it up on. Call it an early "bookshelf" system. It couldn't do any serious amount of volume, but it sounded pretty good for what it was.

IMD can be used to characterize narrow band amplifiers where THD can not. That is the reason it is used for RF linears. If you look at some very old books on audio you will find that very little IMD testing was done and it was not well understood. The general assumption was that if the harmonic distortion was OK IM distortion would be also. This is not the case because the two come from different kinds of non-linearity. IM testing was used mostly for optimizing photographic sound recording for motion pictures. Two method were developed, one by Western Electric and the other by RCA. Both did approximately the same thing but the RCA method is suitable for narrow band testing and the WE method is not. Harmonic distortion, if it is mostly even harmonics, is noticable but not too unpleasant until it reaches very large amounts while relatively small amounts of IM make audio rough sounding. The amounts of both kinds of distortion we are used to seeing in hi-fi specs are much lower than one finds in practical applications. For instance, the old standard for motion picture sound was 5% IMD and systems delivering this were considered to be of high quality. The same for THD, less than about 2% was condsidered very good. Most single-ended tube amps as found in both ham and commercial communications receivers are speced for maximum power at around 10% THD and no IM spec is given. In fact it is quite possible to hear the difference between a single ended amp and a push-pull amp even on fairly restricted audio. Receivers with p-p amps generally have a reputation for having good audio. The same is true for solid state amps where p-p is cheaper to impliment than with tubes because no transformer (always expensive) is needed. Nonetheless the audio specs for much solid state stuff is no better than for old tube gear where

the power is on the order of 2 watts at 10%. I contend that you really _can_ hear this. Probably someone with good hearing can hear the difference between a 2% system and a 0.2% one but it would depend on the program material. Also keep in mind that loudspeakers can be prodigeous generators of IM although this is not usually significant for the narrow frequency range of ham radio speech.

The Hi-Fi period was embarked on to allow you to hear real instruments and voices in you
home,
that sounded exactly like they did in person. A symphony orchestra, talented singer, small
club
combo or a big band could all be replicated with amazing accuracy. You could play a record,
or
even 'some' CDs, and really feel like you were 'there'. A-B tests were performed with live
musicians and a recording, switching back and forth for comparison. Sound comparisons are
extremely difficult unless they are immediately switchable, and of course a different room
may
be entirely different.

The equipment got to be better than the equipment used to measure it, so a 'new' paradigm was
needed. The 'experts' started to hear things that only THEY could hear, which makes one wonder
how important they can be if only one person can hear them!?!?

Add that to what is called 'music' today, how would anyone know what it's supposed to sound like!! 95% of it comes from the 'electronics' rather than from real instruments or human voices. If there ARE any real instruments they are so distorted (intentionally!) that they are
unrecognizable anyway..... 2% distortion? more like 200% 'distortion'.

I'm just thankful I still have my Classical, Big Band and Jazz records and some CDs. :-)

Either C1 or C2 on the main board is shorted or the wiring from the fast agc switch that goes to R17 or R18 is shorted to ground. This would kill the agc voltage and cause the problem that you describe.

Back in the mid-to-late 60s, I had a few friends who were in the radio broadcasting business.
I knew back then that I didn't have a good "radio voice," so I leaned to the engineering side.

If you listen to radio and TV ads today, it's as if this was no longer a consideration.
Most women sound too nasal and too "Valley."

One of the best voices today, which I feel exemplifies the old-school quality of a "radio voice,"
is John Corbett. He does a lot of voice-overs for places like Applebees.
No regional dialect. You may remember him as DJ Chris Stevens on the "Northern Exposure" TV series on CBS in the early 90s.

When I was stationed near Tokyo with the Air Force in the early 70s, all
of us young guys invested a lot of money in cameras and stereo equipment.

There was this store just off base that had a listening room with good
acoustics. We could go in and do comparisons between amplifiers and
speakers.
Granted, most of us don't have acoustically-perfect environments in our
homes, but it was a chance to buy whatever combination sounded the best.

They knew that guys would come over, listen for a while and decide what
to buy, then go to the Base Exchange to buy it.
So they would match the prices, and would even deliver to one's on-base
housing or barracks.

I bought a pair of Acoustic Research AR-3A speakers. Back then, they
were referred to as the "studio standard."
Rarely would you be in a broadcast or recording studio and not see a
pair of them.
The XYL bought a nice pair of Bose bookshelf speakers for me for
Christmas, so I'm going to sell the AR-3As.
It's amazing, the price that these command used today.

When I was stationed near Tokyo with the Air Force in the early 70s, all
of us young guys invested a lot of money in cameras and stereo equipment.

There was this store just off base that had a listening room with good
acoustics. We could go in and do comparisons between amplifiers and
speakers.
Granted, most of us don't have acoustically-perfect environments in our
homes, but it was a chance to buy whatever combination sounded the best.

They knew that guys would come over, listen for a while and decide what
to buy, then go to the Base Exchange to buy it.
So they would match the prices, and would even deliver to one's on-base
housing or barracks.

I bought a pair of Acoustic Research AR-3A speakers. Back then, they
were referred to as the "studio standard."
Rarely would you be in a broadcast or recording studio and not see a
pair of them.
The XYL bought a nice pair of Bose bookshelf speakers for me for
Christmas, so I'm going to sell the AR-3As.
It's amazing, the price that these command used today.

19303. Wanted: TR-4

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-08 01:46:14 UTC
From: <w8cq@...>
Topic: 19303 Message: 19303

Hello All,
I am looking for a TR-4 for a project. It does not have to be pretty or even work, just all of the parts there.

What have you?

Jeff W8CQ

19304. R4A board 1 and board 2 problems

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-08 02:51:44 UTC
From: <rochep@...>
Topic: 19304 Message: 19304

I bought a re-cap kit from 2Bradioparts for my R4A. I am trying to figure out what cap goes where, and I am stumped with C173 and C176. I have posted pictures in the PHOTOS section here so people can look. Photo#1 is "board 1", but this looks nothing like the late R4A board 1 I see on Garey's CD.
Photo #2 is the cap near V7; I THINK it is 10 uF electrolytic C176, but + to pin 1 (OK) and - is grounded. I don't think it should be grounded.
Photo #3. I can not find the electrolytic on "board 1", is this weird blue-bottomed thing the 10 uF electrolytic. C173 should go from junction of R137 (big thing) and R138 to ground.
Photo #4. There is ANOTHER small board just between "board 1" and "board 2". It is not on the Service CD. I will trace what goes where.

How common is it for Drake to change the boards a bit from radio to radio. The S/N of this radio is 5500.

The radio works fine right now. I COULD just replace the caps that I am sure of (and eventually the elec. can), but I wonder what is going on here.

Paul K3STX

19305. Re: [DrakeRadio] R4A board 1 and board 2 problems

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-08 04:08:05 UTC
From: Garey Barrell
Topic: 19304 Message: 19305

Paul -

That must be some sort of 'interim' version! The 'last' revision was at s/n 5400, and the schematic wasn't totally correct. (see the '-k4oah' version on the CD). The model for the 'late' version was a s/n 6600.

If you look at Board 1 on the CD, you'll see the parts from your 'extra' board on the left end.
The 680 resistor is on your board along with Q7 and 8. I'm too tired to figure it all out tonight, but I believe if you look at the s/n 4054 schematic in the VERSION directory of the CD
it might (?) relate more to what you are seeing.

It's interesting in that the boards you have bear no resemblance to the 'early' boards either
and must have been a 'first cut'. The thing is, there aren't many changes in that area from early to late! And yes, Drake wasn't always good about keeping changes 'orderly'.. :-) Looks
like I may need to add an 'interim' version too!!!

Yes, that is probably a Tantalum 10 uF and would be C173. These very seldom fail, and I leave
them alone.

C176 (-) should go to the ungrounded lead from the output transformer to the PHONES jack. It
will work tied to ground, but the original connection applies a little negative feedback to linearize the AF OUTPUT stage.

Thanks Joe for the thoughts

C1 and C2 both check in spec. I wonder about a possible wiring error to the IF/AGC board from the switches too. My downloaded service manual detail isn't very good and I can't read the connections between the switches and the IF/AGC Board

--- epyles@indy.rr.com wrote:

Either C1 or C2 on the main board is shorted or the wiring from the fast agc switch that goes to R17 or R18 is shorted to ground. This would kill the agc voltage and cause the problem that you describe.

73, Joe KC9LAD

At 02:11 AM 3/6/2014, you wrote:

No AGC in slow position or s-meter action, rf gain control does not affect s-meter. Seems to operate the same in AGC off and AGC slow. Have another working R7 and tried swapping IF/AGC boards with no success.
Switches seem to be functioning normally. I do have AGC in medium and fast positions and

s-meter action. Capacitors and Resistors on main board that determine slow AGC time constant measure OK for capacity, Could the polarity be backwards causing the problem?.

Any Ideas?

Thanks!

Thanks so much for your help (and your fantastic CD). I was wrong, my S/N is 5024. I just did resistance checks with my DMM, I know it is not a VTVM but almost every reading was within 10%. A couple were off, a bit low (but not much).

C176 is a new one (someone was in there before me) and I'll leave C173 alone for now. I'll replace the others (assuming they are easy to get at) and then tackle the filter cap assembly. I'll have to post a proper pic of the radio, she's a beaut.

Check the Molex pins for cracked solder on the botton side of the parent board.
Also check the top side, I had one that actually had a huge blob of solder on
it that deformed the female contact. Also check soldering on the IF/Audio board
under magnification and good lighting. It might be a good idea to check
clearance between components and the connector bodies on the IF/Audio board.
I've had it happen that a component is bent the wrong way and will short to the
male pin portruding from the rear of the female socket.

-- Steve

At the time I was an AR fan, I thought they sounded very smooth and good. The problem was that AR built a gentle roll off in. To be reasonably flat the level adjustments for mid-range and tweeter had to be full up. If you put them at the levels marked by AR the speakers sounded muffled.
I don't know about newer drivers but there were later speakers systems that were better such as the English KEF and some others who's names are escaping me. One of the great improvements was getting away from felted paper cones. The later plastic ones had far less parasitic output and smoother response. A lot of these differences were quite easy to measure if you had a lab grade microphone and associated equipment. I used 1/2 or 1/4 inch B&K mics and got interesting results. Quite often I was able to predict what a curve would look like from the sound of the speaker. There were some highly reputed speakers I though sounded awful and measured that way too. For instance the much vaunted Tannoy Monitor Gold. these had very ragged high end response as one might have expected from the design of the compression driver. I once tried using a pair for monitoring- ugh.

Wow, this has turned into quite an interesting thread.

We have now a generation that is conditioned to accept crappy audio and horrible music. I'm sure Garey will remember the days when hams used to spend hours tweaking their stations to produce the best sounding signal they could. Now we have crappy cell phone audio, quirky restricted D-Star, and cheap CB-grade hand mics. The music business is over-compressed and formulaic, intentionally distorted music is upiquitous as the MP3 format, stars are born not based on their talent but rather by how big of a freak they can be, and auto-tune removes the heart and soul from vocals. Every other song on the radio sounds like it uses the same beat track, the same front guy talking smack, and the same reverbed and layered girl singing.

How far we have fallen.

You might say that I "checked out" of the hi-fi SSB idea before I checked in. It seems like a phool's game IMO. Not unlike my evolved attitude towards my home entertainment audio system, where I realized early on that it was pointless to spend thousands of dollars on systems with attributes that a dog would be hard pressed to hear. No matter how much you spend there will always be something else on the horizon to suck money from your wallet. As long as I have something that sounds decent and doesn't hurt my ears, I'm happy.

My goal with playing with different microphones is not to produce a signal that sounds better than anyone else. As Bob alluded to and I have talked about in the past, different mics have characteristics that are better suited to various different operating styles and voice characteristics. Good "communications" mics are based on someone's notion, based on laboratory science or personal opinoin, of what communications audio should be. Bad communications mics are a cheap cartridge slapped into an even cheaper housing. My interest in the pro mics is to try something out that has a reasobably flat response and will reproduce voice audio accurately to see how it makes me sound on my radio. That's about it.

There is no perfect mike!

Each type is different. What is the element?

At least dynamic mikes don't die with age. Old crystal mikes are the worst.

In the early days the broadcast industry used condenser mikes.

No mike is flat.

I doubt many hams have what it takes to really test a mike.

The broadcast industry uses equalizers for a reason.

But if you are operating SSB just find a mike that works and use it. You can't fix SSB audio.

From: <rochep@...>
Topic: 19315 Message: 19315

I have been reading that C90A on the R4 and R4A "is not used at all", but my original can there are wires connected to EACH of the four termoinals. Is this not C90A, B, C, D? What am I missing here. My plan was to put the four-position Hayseed cap in its place and connect ALL the wires as they are in this original R4A.

>No mike is flat.

I said "reasonably flat". The RE-20 and my other pro mics qualify. I work in the facility where some of these are still manufactured, so I know this first hand. The RE-20 is very nearly ruler flat over the "communications" range, and +/- 3dB from 80 Hz to well above 10 KHz with the EQ selector set to flat. I can look up the specs on my other RE- and PL-line mics if you like.

>But if you are operating SSB just find a mike that works and use it. You can't fix SSB audio.

I disagree. SSB audio can sound quite good if you have decent equipment on both ends and tune carefully. I have a non-Drake radio that a previous owner of this model has stated on numerous occasions that they do not make a good contest radio because "everyone will be stopping you to ask what kind of rig you are on because the audio sounds so good". I tend to believe him since he is a veteran contester with an original K0 call. A careless mic choice is not in anyone's best interest. It does make a difference.

Hi All,

You can transmit a broad bandwidth SSB signal but it wastes spectrum and requires an equally broad receiver to make the most of it.

Ye olde phasing method of SSB generation (and demodulation, too) has the potential to generate such a signal with at least fair fidelity. In principle, rather wide bandwidths are possible, esp. using digital signal processing techniques.

Filter-type SSB generation tends to beat the tar out of audio signals (due to poor group delay characteristics of steep filters).

Well one strong point of single sideband for communication is to reduce the bandwidth of a signal to a minimum. Less interference was fortuitous fallout.

Collins found that the band span could be 300 to 2700 Hz, or 2.4 kHz bandwidth. We all know (right?) that the human male voice has most of its energy at the low end of that spectrum but has most of its intelligence(?) at the upper end. So spectral processing is quite useful.

It's important that the transmit bandwidth and receive bandwidth be equal to each other to insure that no energy was wasted (on tx) outside of that bandwidth. Ditto on rx, no sense in listening to a part of the spectrum where no speech energy was transmitted--maybe only noise or QRM there.

When I listen to the Darth Vader crowd, I often have to invoke some bandpass tuning a la R-4A to listen to a slice of an SSB signal that contains a surplus of LF audio energy. Sometimes, such a signal makes the S-meter lively but the *recovered* audio is poor due to filter bandwidth and spectral mismatch.

So, match bandwidths on both tx and rx AND make sure that bandwidth is put in the right place.

Regarding the Drake 9 Mhz filter bandwidth in TR-4:

I have experimented with some wider filters (3.1 KHz B/W) in my TR-4 and TR-4C. I believe I would prefer a 2.8 KHz B/W for my own tastes but 9 Mhz LSB/USB filter pairs are hard to come by, especially at a reasonable price. There are some KVG filter pairs available from a reputable surplus source (located in Israel) on the auction site. The filters are contained on a PC board removed from a piece of surplus radio gear. The LSB/USB pair are KVG S43 and S44. These are high quality 8 pole filters that are fully specified (1000 ohms imp, same as Drake).

KVG makes some really nice crystal filters. I have used the XF-9 series in a lot of homebrew projects.

I managed to fit the pair on the existing filter bracket in my TR-4, after re-drilling it. It was a tight fit to the old bracket, so when I did the TR-4C I simply made a new bracket using some pieces of heavy gauge tin plate (double sided board would be OK).

The filters are not expensive and the shipping is free. The boards can be had for between 40.00 and 50.00 shipped. Plus, there is a third filter on the board, a KVG S42. This is a 7.2 KHz B/W AM filter. What more can you ask for? I have no affiliation with the seller except to pass along this bit of information to, what I believe, is a good deal.

As to the outcome of my experiment - I received very favorable reports from the local audio folks. I need to do more work on the 12AX7A mic amp and get a little better microphone. On receive the guys sound really good. It appears the single carrier osc at 9 Mhz is OK with this filter pair, however it seems a little touchier getting it set for near-equal pich on each filter. I would recommend this filter change out only for someone wanting a radio to ragchew with the audio folks, with the wider filters there is a little more crud to deal with. But, I will say the KVG filters have a really nice shape factor and do OK at the wider B/W.

Thanks, Byron WA5THJ

what is the value of C90A ? I have seen this done many times and figured that they used what was available .
if they needed a 3 section electrolytic can and what was available was a 4 section they would buy it and leave
the unneeded terminal open rather than going to the expense of having a 3 section custom built .
forty years in the TV/Radio service industry I have seen a lot of strange circuits and practices .

I had the same problem, finding C90A in my R4/R4A schematic, never found it. However I did find it on my R4B schematic, it's off V7's screen at the junction of R136 and R137.

I have a later 6K serial number R4A and C90A (20ufd 200VDC) has 2 White/Violet wires connected to it. One White/Violet wire connects to the small PC board (AF AMP/PTO MATCH) located directly behind the volume control. I can't say if this is how your R4/R4A wiring is but this is how the wiring in my R4A is.

C90A shows up on the R4B schematic at the junction of R136 (1K 1/2 watt) and R137 (10K 2 watt) and pin 6 (screen) of V7.

Paul -

OK. Sounds like you're on your way! Yes, you should use the schematic in the VERSIONS directory, the '4054'. There aren't many changes, but if something doesn't look right, check
the earlier schematic. I don't think there are very many changes, that model was pretty well
settled by then. Usually changes showed up in the AVC area.

I still don't know what to say about those boards. I've never seen one like that. They may have been an 'update' from the original 'early' boards that were then combined for economy. If
you compare components, I believe you'll find that the schematic matches (mostly! :-)) 4054.

Resistance readings are ok, but I usually just refer to the voltage table instead.

Let us know how you get along, and do post a photo. Always nice to see a 'pretty' one!

I think C90A was originally intended to be the Cathode bypass on V7, from the beginning, i.e.,
the R-4. It fits with the original component numbering scheme, and would be logical. But I believe wiser heads prevailed, (or bean counters,) and determined that it made more sense to go
with a three section Twist-Lok and just put a small cap right at the tube socket. Hum reduction? Coupling between power supply filters and audio bypass? It's now identified as C131, near the end of the capacitor id's, indicating an 'afterthought' or field change.

C90A did reappear in the 'late' R-4A as C172, additional decoupling to the V7 Screen and for the
low voltage supply to the solid state AF Preamp stages that first appeared in the 'late' R-4A.
When the R-4B was designed, C172 was 'moved' inside the Twist-Lok and became the long lost C90A! Drake's draftsmen were not shy about 'reusing' component id's when drawings changed. This resulted in TWO of some component id's on a few schematics, and even THREE in one instance. :-)

Hi All,

You can transmit a broad bandwidth SSB signal but it wastes spectrum and requires an equally broad receiver to make the most of it.

Ye olde phasing method of SSB generation (and demodulation, too) has the potential to generate such a signal with at least fair fidelity. In principle, rather wide bandwidths are possible, esp. using digital signal processing techniques.

Filter-type SSB generation tends to beat the tar out of audio signals (due to poor group delay characteristics of steep filters).

Well one strong point of single sideband for communication is to reduce the bandwidth of a signal to a minimum. Less interference was fortuitous fallout.

Collins found that the band span could be 300 to 2700 Hz, or 2.4 kHz bandwidth. We all know (right?) that the human male voice has most of its energy at the low end of that spectrum but has most of its intelligence(?) at the upper end. So spectral processing is quite useful.

It's important that the transmit bandwidth and receive bandwidth be equal to each other to insure that no energy was wasted (on tx) outside of that bandwidth. Ditto on rx, no sense in listening to a part of the spectrum where no speech energy was transmitted--maybe only noise or QRM there.

When I listen to the Darth Vader crowd, I often have to invoke some bandpass tuning a la R-4A to listen to a slice of an SSB signal that contains a surplus of LF audio energy. Sometimes, such a signal makes the S-meter lively but the *recovered* audio is poor due to filter bandwidth and spectral mismatch.

So, match bandwidths on both tx and rx AND make sure that bandwidth is put in the right place.

A great deal of the research into transmission of speech was done at Bell Labs including the famous work of Harvey Fletcher and others. More was done to find optimum conditions for military speech communication. The Bell System found that extending the low end beyond what was needed for intelligibility was necessary for "natural" reproduction, something demanded by telephone subscribers. So, the telephone system went down to about 250 hz. This is an octave more than is necessary for communicating intelligence. The high end of the phone system was limited to about 2750 hz for a total bandwidth of 2500hz. This was applied to the band filters for multiplexed long distance relay systems, local calls had condiderably wider bandwidth. The research by Licklider and others shows that under _noise free_ conditions the best inteligibility is obtained with wide-band unprocessed speech. It is under noisy conditions and in power limited systems that band limited, compressed or clipped speech is superior. In fact, in noise-free systems that are not power limited processing _reduces_ intelligibility.
Now, in general, ham radio communication, at least in the HF bands, must be considered a power limited, noisy, system so speech processing is advantageous. However, one may find, like the telephone company, that naturalness can be important emough to require somewhat compromising maximum speech power.
I remember when the Collins S line first began to be heard on the air. Collins had gone from the 3.1khz filters used in the Gold Dust Twins to 2.4 khz filters. There was wide complaint that the new equipment sounded like a telephone. It may have been superior from a purely engineering standpoint but was not pleasant to listen to. Having said that I hear hi-fi SSB signals periodically. In fact, they are sometimes very strange sounding perhaps due to the kind of processors being used. I do have receivers with wide enough bandwidth to hear the entire signal. Hi-fi AM usually is no more than extending the bass a bit but listening to the 75 meter AM nets locally just reminds me of why AM disappeared for general use once SSB came around. They may sound good but, unless quite strong, are difficult to understand. Also, the notorious E.F.Johnson "sound" does cut through the junk better than the hi-fi rigs although it does not sound as pleasant.
The "sound" of a SSB signal can be strongly affected by the filter in the receiver. Some are just harsh sounding. I have an RCA AR-88 in my shack. This has very wide band IF filters and good audio. It can't eliminate interferrence like my R4B but sounds better on most signals.

One other bit of memory: When I was starting out one of
my neighbors was Ted Gillette, W6HX. Ted had a home brew rig
and had a very penetrating signal. He used a D-104 and lots
of clipping. This was also not a pleasant sounding signal
but you could hear it through anything. Ted's station is on
the front piece of one of the Orr _Radio Handbook_ editions,
I don't know which but would like to find a copy.

As I mentioned before, the 7075 appears to be essentially a Turner +3 without the compression amplifier. It's a ceramic mic that tends to sound very good in my experiece. I consistantly get unsolicited audio compliments behind the +3 on my TR-7. When I asked the Brit running W1AW/7 on 15 Meter AM for an audio report last week he said it sounded "fantastic". I was looking more for an assessment of the sound of the wideband AM from my TR-7 than of the microphone itself, but either way I'll take it.

I used to operate almost exclusively with the narrow (1.8 KHz) SSB filter because it reduced noise and interference. I was so used to it that 2.4 KHz sounded too wide to me. Interestingly, I have noted that since I did the RX audio mods to my 7-line I find myself more often than not switching to the 2.4 KHz filter because the signal can be made more intelligible and pleasant to listen to. I use the 1.8 somtimes in heavy QRM or noise to pull one through, but not as much as I used to. Then again, some stations have such horrible audio that no amount of tweaking the PBT or bandwidth helps much.

Garey
Having a low voltage section in a can electrolytic with one or more high voltage sections is asking for trouble .
as they use a common ground it is not uncommon for internal leakage to occur between the sections when the can gets some age on it .
I had to clip many 25 volt sections loose and replace with separate filters in colour TV's that had 3 450 volt sections and a 25 volt section for the audio cathode bypass . am retired from the TV service industry .

Subject: Re: [DrakeRadio] Re: Drake Microphones

I used to operate almost exclusively with the narrow (1.8
KHz) SSB filter
because it reduced noise and interference. I was so used to
it that 2.4 KHz
sounded too wide to me. Interestingly, I have noted that
since I did the RX
audio mods to my 7-line I find myself more often than not
switching to the 2.4
KHz filter because the signal can be made more intelligible
and pleasant to
listen to. I use the 1.8 somtimes in heavy QRM or noise to
pull one through,
but not as much as I used to. Then again, some stations have
such horrible
audio that no amount of tweaking the PBT or bandwidth helps
much.

73

NU0C

I think a lot of this is due to the digital processing
available in many (all?) modern rice box radios. I have
many times heard someone testing with someone else and
tweaking things all over the place. None of the adjustments
sounds good but none of them ever just turn the thing off.
There also seems to be no understanding that the receiver is
going to have a strong effect on what is heard. I heard
some DX station the other day with so much processing I
absolutely could not understand a word. The stations working
him sounded fine. I don't know how he got away with it,
maybe people with better hearing than I have did better.

Andrew -

Good point. I seem to recall that also somewhere in the dim past! :-) That leakage may also have had something to do with the PS ripple getting on the audio stage, which is what I remembered. There were a lot of those 'two high voltage and one low voltage' in radios also.
Probably seemed like a good idea at the time. These only have half that high voltage, but still. The four section caps used in these guy's radios are all ~250 V.

I've done some TV service too, house calls with the big tube caddy even! :-) How's that for dating someone??

No Jim, NOT that kind of dating!

I'm in the process of replacing C90 right now. On the newer 11-tube version of the R4A The capacitor C90A can be found on the schematic near the upper right corner of the schematic. It is identified as C-172. On the older R4A receivers this was a separate capacitor.

The Hamfest Haystack capacitor replacement kit includes a separate 22µF capacitor as well as the C90A 22/250V section.

There is one particular model of Yaesu, very expensive, that has a distinct sound that I can only refer to as mushy and "artifact-ey". I can always tell one on the air. It's a bit like the Cylon from BSG that someone else mentioned, but difficult to describe if you haven't heard it. I don't think it sounds good at all. I worked someone at ARRL HQ a few years back that was using one and I really had to bite my tongue to keep from telling him that his audo sucked. I probably should have told him.

Some of the foreign stations that I hear during the DX contacts are absolutely horrible. The audio is so bad and they rattle their call off so rapidly that it is practically impossible to get the call correct. I just want to tune past them and find another contact.

The last sounds like what I heard a couple of days
ago. I don't know how anyone could work this fellow.
Digital processing can do a lot more than just equalize
and compress. It can do things that no linear circuit could
do such as add non-harmonically related frequencies to the
signal. I think the first box to do this was the Aphex,
made for recording studios but also used in broadcasting.
It can add highs where there are none and can sound very
strange. I don't think any of this makes signals more
readable under any circumstances but its there on the menus
so folks use them. I wonder how many hams have stuff set up

on their rigs they don't know about. I hate multi-layered menus, fortunately, my old-fashioned Drake rig doesn't have any.

From: <k6ctw@...>
Topic: 19344 Message: 19344

All - I got an R-4A on eBay and am very happy with it cosmetically. Replaced the #47 bulbs and put in blue filters and it looks new when powered on. Did the PTO stability mod with the piece of braid and glued the cap on the PTO coil back in place. It did have a bit of hum though so replaced the electrolytics with the Hayseed Hamfest set. That cured quite a bit of it. However, in replacing the electrolytic can you have to un-screw and move the PTO so that you can take out a screw holding a transformer to unsolder the bent over pins on the old and new electrolytic can from the chassis. When I put everything back together, it works much better, with a lot less hum (I must still have a cap, orange drops on order, or tube somewhere that needs work). The only thing is that the dial calibrarion is now 12 KC off and I can just barely get the dial to the right place with the little red knob. Looked thru the maintenance section of the manual I printed off and it doesn't really explain how to reset that. I know I need to get Gary's manuals on CD (ordering right after I get done with this) but if it's quick, I'd appreciate any advice. Thanks in advance - 73 - Ken Miller, K6CTW

I am not sure about the R4A but if its the same as on
the R4B the frequency dial slips on a hub. Check its end
points. With the dial pointer centered the dial should come
to the center of the two arrows. If it does not you can slip
it over with your fingers from behind. If you had the VFO
out or loosened it quite possible the dial got moved.

Ken,

You may have bumped the PTO when you had it out. The gear near the front is held in mesh by a spring. If you back that gear out with your finger, you can turn the dial to a position closer to the actual frequency. You'll probably find that it skipped one or two teeth.

Ken -

Welcome to the club! Or rehab group, as the case may be!

If you look down on top of the PTO gearbox, from the front, you'll notice that there is a spring
pulling on the shaft of the nylon gear on the left. The hole in the front gearbox wall is elongated, allowing you to push that shaft to the left, disengaging that gear. While it's disengaged, the transparent dial will rotate freely and you can set it very near center. If it
wants to settle just to either side of the front panel fiducial, you can hold the main transparent dial and turn the MAIN TUNING knob. The dial will slip, and you can set it right on
the center mark. It may be a little hard to get it loose after 50 years, but it will move.

This raises and interesting point, Jim.

I suppose back in the days of olde, most hams would really want to know if their signal was off, so they could do something about it.

Now if you tell a guy his signal is off, you risk insulting his intelligence, perhaps because he spent thousands on a radio that doesn't even sound ordinary.

I'm not sure which radio you're referring to, but I have talked to two hams with IC 7800s that sounded . . . hmmmm. Just lightly less good than average. Could be in the settings.

19353. RE: C90A. Where is it?

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-09 21:25:03 UTC
From: <rochep@...>
Topic: 19315 Message: 19353

Good news. I replaced the old electrolytics with a Hayseed can. I basically followed directions outlined by Terry Dayton on his YouTube video. I do not have a Dremel tool, but I used a Dremel grinding bit with my regular electric drill. Wasn't easy, kind of scary grinding metal tabs in the guts of a beautiful old radio, but it came out fine. And went went back together fine.

Bad news. Radio does not work now! To be fair, I DON'T think its because of my filter cap job. I replaced the paper caps, after each one tested radio (and it was fine). I noticed last night I heard a sort of "pop" in the audio, then it was dead. But then gave it a whack, and audio came back.. I found this behavior on and off all night. I think it a the 6EH5 audio tube cuz it I just touched it it would go in and out or PFFZZT or (bad connection?). But no way to test this tube.

I think my audio tube is shot, ordered a new one. "Radio" seems to work, I can peak the S meter, it goes up and down as I tune across the bands, and I can peak the CAL tone. Just no audio.

I checked my B+, seems fine. I'm not too worried, but a bit disappointed. Once new tube comes in I will do detailed voltage checks (resistance check was basically fine, the only resistance values that were low with my DMM were on the audio tube. Oh well.

19354. Re: [DrakeRadio] Re-Calibration R-4A

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-09 23:13:04 UTC
From: <k6ctw@...>
Topic: 19344 Message: 19354

I'm really not new to the restoration of Drake gear having completely rebuilt a 2-B/2-BQ. Also own and have upgraded my R-4C with the Sherwood mods and have maintained my T-4XC and rebuilt it's AC-4. The R-4A (old style 13 tube) was a pleasant surprise as I didn't expect to win the auction. However, I was looking for either an R-4A or a 2-C (with 2-NB) as my 2-B has become un-usable on the PAN winter frequency because of some nasty noise. Thus I needed a noise blanker equipped receiver to go with the Heathkit DX-60. The R-4C's noise blanker handles it fine by the way.

Love Drake gear and maybe one of these days I'll get a 2-NT as well.

Thanks again for the excellent help (this really is a great forum) and look forward to getting the K4OAH CD!

Topic: 19344 Message: 19355

Thanks again to all, the R-4A is now back on calibration. I've been very impressed with it so far. Now I have to replace a couple of tubes that are "going" (e.g. the 6EH5 is microphonic) and i've decided to replace some of the capacitors with new polypropolene ones. Once complete, a friend has agreed to let me use all of his lab bench equipment and I'm going to do a full re-alignment and calibration. That should finish the restoration. Then on to building a speaker for it!

From: Garey Barrell
Topic: 19344 Message: 19356

Ken -

Check R43, and especially R44. The Cathode voltage should not be over 3 VDC. This sets the current through V7, a very 'hot' stage. R44 going up in value -OR- a gassy 6EH5 can increase
this current, resulting in an open Output transformer, T16. Just a little overcurrent in this
stage stresses R43 causing it to go up in value.

From: Joe W2KJ
Topic: 19357 Message: 19357

Been toying around with the idea of getting a TR7 or TR7A to go with my C-Line and TR4CW/RIT...I've always wanted a TR7 but never managed it.

I'm wondering what the going prices for these units are these days...I would love to get a TR7A but probably out of my price range.

So....any comments or suggestions as to pricing for a nice unit??

Many thanks for any info.

Joe,

There is a wide range of prices depending on what filters are installed, with or without noise blanker, with or without AUX-7 board, with or without fan, etc. Typically they are sold with a power supply but occasionally not. Cosmetic condition will affect price too. Whether it is a TR-7 or the A model is relevant also. Having said that, I've seen prices over the range of $600 to $900, "depending".

Good luck on your search.

73,

Evan, K9SQG

Hello Joey,

Evan is quite right. Here in Germany prices are different so it may not be of much value if I told you ours.

But I would add a little bit:
- A TR7A is quite high in price. But if you want a TR7 for operating (not for collecting), just take a TR7 (without A)
- Higher serial numbers have the non-sticky cabinets. I prefer these. They just look better.
- AUX7 boards are nice but not needed in my opinion. You can easily go to any frequency using the up/down buttons of your TR7. Transmitting on all bands needs a little mod. AUX7s go for very high prices if sold separately.
- The NB7 is rarely needed in normal operating conditions. But it will cost an extra $100 or so
- Filters are sometimes hard to get. A loaded TR7 will relieve you from the effort to get all the additional filters. In my opinion, the 1.8 kHz for SSB is very good. For the serious CW op you need at least the 500 Hz. The 300 Hz filter is nice but only needed in very crowded bands.
- The PS7 will give you plug and play operation. It is large and heavy but very reliable.
- A fan is good if you operate contests. It need not be an FA7. Others will work fine, too.

Just my personal thoughts...

I would never want to give away my TR7. It is an extremely good radio that can easily compete with modern ones.

Yes. It requires taking the meter top off. There is a slotted adjustment for the meter magnet. Sounds like something is stuck in there though. I would take a close look at it first.

Joe, the answer is maybe. I believe most of the meters do have a screw to set zero, but a small number don't. You won't know until you get the meter assembly apart.

See the photo I posted some months ago that shows the screw location.

Be sure you mark or otherwise note the termination of each of the four wires.

To add to what others have said....

There is absolutely no technical advantage to owning an "A". You are paying extra for a letter. Same radio. And unless you get a money back guarantee that the options are all there, you could be getting a stripped unit. Circuit improvements over the years have been minimal, and there is absolutely no functional difference that you would be able to spot between a loaded late model non-A and an A.

Hamfests and private sales are the best places to find deals. If you are capable and prepared to do some refurb work, I've seen $300 or less (without PS-7). Sometimes for fully loaded units. I have found that often if the unit has the Drake-labeled fan on the back it has at least some other options installed as well, but there is no way to tell from the outside unless you can power it up and give it a good test run.

The fans are highly recommended, period. Both for the rig and the PS-7. They are a common form factor, so any fan that fits the hole can be made to work. They help with stability and component life. Mount them to pull air OUT.

Don't turn your nose up at the noise blanker; if you live in an area that is plauged with power line noise the NB can be highly effective. While it is true that the AUX-7 is not needed, it's handy for access to the WARC bands and saves a lot of wear and tear on the UP/DOWN buttons. If you are contemplating operating split, get an RV-7 to go along with the TR-7.

You don't need the PS-7 to run the radio. Any decent 13.8V 30 Amp power supply will work with an appropriate cable.

I don't think you will be able to listen to 0-1.5MHZ (LF) without the AUX7 (with the LF modules) unless you do a programming diode mod to the mother board. So if you ever plan on doing any LF DX work you might want to find one with the AUX7 board. Dieter is 100% correct these boards get pricy if you buy them after-the-fact, so it's probably best to buy a TR7 with one already installed.

Not always a "scam." Drake did many "upgrades" and added the strips themselves. And I have a very early TR-7A which has everything except the extra mark above the aux audio jack. So don't be too quick to call "scam." Dave S.

Thanks for the info Evan...I've read a bit about this type of scam on the WB4HFN Drake page...very good info there.

73, Joe W2KJ

> Jim's posting triggered my memory. There are some TR-7s that have been altered to look like the A model. I'm not talking about the electrical improvements between the standard TR-7 and the A model, I'm referring to people that have added the "A" front panel strip to a standard TR-7 to command a higher price. Just a word of caution...

Finally something I may contribute to....:)

I purchased a pretty complete TR-7 setup almost a year ago.
And thanks again to the gang on here for the HELP!

As a result, I have been watching prices on a regular basis.
They are everywhere from $500 up to $1000 for a working TR7 alone, no PS or other peripherals.

It appears that a working TR7 is worth more broken up into individual boards than as a complete unit. I think this is driving the price higher and higher. The TR7 is unique in that "motherboard" construction so it lends itself to being parted-out. Any other opinions on this?

Having said that, I got mine for $350 from a fellow club member.
I got everything except a speaker.
PS, VFO, Electronic Keyer, Speech Processor, Mic.
I love this radio.

Morale of the story is, keep looking and good luck

Bill...good going on such a find.

If anyone out there has a TR7 with PS, VFO, electronic keyer, Speech Processor and microphone all for $350 please let me know I will buy it (grin)!!!!

Seriously, a high serial number TR7 is something I would seriously consider.

Joe,
I have kept quiet on this thread, but there is something we are missing telling you that we really should. Actually, "high serial number" can be any number above one I have just bought from a good friend that is serial numbered 5352. You can tell because it will have a three sectioned rear panel. Those serial numbers and up will contain most of the "improvements" or they can be easily added to the rig, so you gain very little paying the high prices commanded for the TR7A or "VERY high serial numbered", RARE, rigs, HI. Just the experiences of one who owns more TR7's than I will admit at any one time, HI. A good friend of mine had bought this rig new, making it a one owner that contains nearly every accessory that Drake sold for them. What it doesn't have, I think I have collected over the years from others I have bought. I will likely have to put a little time into it, as it hasn't been even turned on for 20 years, but that's part of the fun!!!

Just look around, keep your eyes and ears open and you will find one that you can buy. I will likely sell some of mine later, some as projects, but am not considering it right now.
Good luck!
73,
Don, WB5HAK

You don't even want to know about the estate system I fell into a couple of years back. It needed serious cleaning, but included a loaded TR-7, RV-7, PS-7, L-7, DL-1000, and 7077 mic. I cleaned up and sold the TR-7 and RV-7 to a good friend that I wanted to introduce to Drake (who now has four or five TR-7s, I forget exactly) for basically what I had in the whole package less the L-7. The L-7 from this estate made it's way to me after the original purchaser found out that it had a bad tube (unsoldered filament). So I ended up with the L-7, PS-7, DL-1000, and 7077 for less than what you might pay for a basket case, stripped TR-7 at a hamfest.The tube worked after I soldered the filament pin, and I mixed and matched the tubes with a set of pulls from another friend's Henry that also had one unsoldered filament.

My single-owner R-7A was literally a garage sale find by a fellow ham who knew I was into Drake. It was offered to me for a price that, shall we say, I could not afford to pass up.

A few months back David, KD4E, offered me a fixer-upper TR-7 at a fair price. I took a chance on this private sale, knowing David from previous internet interactions, and got a fully loaded rig in decent physical shape that just needs a little work. It will become my spare.

So yes, the deals are out there. I saw good deals often at hamfests around here until I decided that I wanted to pick up a spare. Now that I have a spare, I will probably start seeing them again.

I have had the same thing happen but had a much larger error. During cleaning I managed to get the gears out of synch. If you understand what has happened its not hard to fix. Another problem is if the stop pin gets sticky. The dial can just keep turning. The stop pin can stick because the lubricant has turned to glue. It can be cleaned with alcohol or naphtha and a drop of light oil put on it. Once you get the gears and the rest clean the VFO is very smooth. While the gears can get out of synch its easy to fix and you really have not broken anything.

19379. Help With MSR-2 Repair

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-12 01:05:01 UTC
From: <swradioman@...>
Topic: 19379 Message: 19379

I wondered if anyone is familiar with a tech who is willing and capable of working on the MSR-2 receiver. It is a commercial receiver from the late 70's and is suffering from low sensitivity in the LF and MW ranges. I suspect that it may be the connectors since they are the RCA variety, but wondered if there is a place that it can be shipped to be looked at? John Kriner, Jeff Covelli, and Ron Baker have been contacted and they are not interested in servicing the unit. Full schematics in the original manual are available. Any thoughts or any help is greatly appreciated! Thanks!

Randy

19380. TR-4C - No output

From: Steve VK2SJA
Topic: 19344 Message: 19380

Hi All,

Any and all help appreciated...

Setup test bench for neutralization (Cold Screen-Grid procedure. Nothing disconnected as yet).

Did not get past step 1. Which is to tune to radio as per normal to get all the adjustments into the ball-park.

Selected 21Mhz to make life easy on my first try.

Found that when I try advance the XMTR GAIN control to move the plate current meter up-scale slightly. As per the tuning instructions in the manual. Nothing happens. The plate meter resolutely stays at the .1 idle current setting.

Any suggestions for where I should start looking?

73, Steve

Hi Steve -

Well, at least the receiver works, right?

Assuming the receiver DOES work, there are very few places to go wrong.

First, the SIDEBAND switch MUST be in the '-x' position. Then switch the MODE switch to 'x-CW'
and increase the XMTR GAIN for an increase in PLATE current. If no increase, the first thing to
check is the '-x' relay on the back panel in the CO area. This relay switches a small capacitor
in series with the CO crystal, raising it's frequency into the passband of the '-x' sideband
filter. If that relay does NOT pull in, no shift, no carrier! You should be able to hear or
'feel' it click in when then MODE switch is set to the 'x-CW' position.

From: Steve Toth
Topic: 19344 Message: 19385

This may be too simplistic, and you have probably already done this, but.....
I was doing the initial tune up on 15 meters the other day when the drive plate current on my T4XB suddenly dropped to a fixed level - nonadjustable. I knew the 12BY7 driver tube was good as I had recently replaced it. I decided to start over, but before I did I ran the bandswitch through several positions. The rig tuned up normally. Time to get out the DeOxit.

Just a thought.....

Topic: 19306 Message: 19386

I did get the original R7 up and running fine again. It had a bad spot on the +5v trace on the motherboard. And the R7A Intermittent is behaving too...

I do have another R7 I can use to swap boards with. I did try swapping the IF/Audio board with no luck. I do appreciate the feedback.

Check the Molex pins for cracked solder on the botton side of the parent board.
Also check the top side, I had one that actually had a huge blob of solder on
it that deformed the female contact. Also check soldering on the IF/Audio board
under magnification and good lighting. It might be a good idea to check
clearance between components and the connector bodies on the IF/Audio board.
I've had it happen that a component is bent the wrong way and will short to the
male pin portruding from the rear of the female socket.

Damien -

More likely, the fault is in the 'slow start'. That's just asking for trouble. These radios are NOT designed to be run with any less than 120 VAC +/- 10%. Or 240 VAC +/- 10% in your case. Whoever started that &%$# should be shot! If you just MUST play that game, start the power supply with NO load, but NEVER run a piece of electronic gear at less than 10% below it's
expected voltage.

Hard to say what might have been fried. Smoke indicates a damaged component, that may or may
not be fatal. The area overheated 'may' indicate that one PA tube started to conduct before the
others, and without proper cutoff bias may have saturated. That tube is probably toast, and/or
the Cathode resistor or RF chokes in that area.

AGAIN.... NEVER run a Drake transmitter with low line voltage. Just one disastrous mode is the
result of insufficient bias voltage to cut off the PA tubes -AND- the relay tube, causing the
relay to pull in, resulting in what you probably experienced.

Topic: 19315 Message: 19388

My 6EH5 audio amp tube is dead, another is on its way. I have replaced filter caps and have been measuring voltages using a DMM (NOT a VTVM). All voltages are good (within 10%) EXCEPT on one of the grids of V3, the 12BE6 2nd mixer/xtal oscillator. Instead of reading -11 volts, I am reading NOTHING (well, about – 14 mV). I THINK the 2nd mixer and xtal oscillator stage is working, I can see S meter move as I tune across band and as I turn on xtal calibrator.
I know this was measured with a DMM and not a VTVM, but is this something I should be concerned about BEFORE I plug in my new 6EH5 audio tube? Don’t wanna blow a new 6EH5, but I have no reason to believe (other than the crazy voltage reading) that V3 is not working properly.

Paul -

Nope, exactly WHY you use a VTVM.!! The DMM probe, lead, and your hand all conspire to kill the
oscillator at this point. Obviously it's oscillating, or you wouldn't hear anything from the
receiver.

The VTVM has a 1M resistor at the probe tip to isolate all those nasty loads, and the
distributed capacity and inductance of the shielded wire lead further isolate the meter from the
RF. You can get an 'indication' by wrapping one lead of a 1M (or so) resistor around the DMM
probe tip and probe with the other lead.

As I said earlier, the 6EH5 is a 'hot' tube in normal operation. This can result in capacitor
and resistor degradation, compounded by additional current caused by that degradation. Tube
sockets and pins are subject to oxidation at a higher rate than 'normal', and the sockets can
actually lose their 'temper' (become 'non-springy' over time. This is why the tube 'feels
loose' and gets noisy. Socket replacement is a good idea, with a quality ceramic type.

Date: 2014-03-12 20:06:39 UTC
From: <rochep@...>
Topic: 19390 Message: 19390

If I get a 39.1 MHz crystal for the 28.0-28.5 10 meter CW band can I simply remove the existing 39.6 MHz crystal (for 28.5-29.0 MHz) and put the new one in its place (i.e. do NOT put the 28.0 MHz crystal in an accessory slot on the back but in the crystal 39.6 crystal slot on the chassis)? Would this require "tweaking" of the coils? Or is this a bad idea? I have no intention of ever listening to 10 meter SSB.

Hi Guys and Ladies, I guess there are some that put up with a bunch of Drake Nuts as my wife calls me (sometimes) and we won't go into what she calls me at others. I had a problem with this before and emailed Garey direct and he put me on the right path it was CR19 in the T4XC, I changed it out and it has worked really well ever since. But the plot thickens I can and do use it most nights on 3.643, I try to switch rigs regularly. It will work all night with no problems UNTIL I turn on the L4B then it will work around 30 min. and stop transmitting just like before.I run it with the R4C controlling and also with the T4XC it does the same no matter how its configured,I thought it could be the relays in the amp. so tonight I put another L4B in line and it did the exact same thing, it would only put out a watt or two, so by that I don't think it could be in the amp relays. The C line is really stable, stays where you put it without moving around. I'm dumb as a rock on these things just smart enough to own a bunch of Drakes.
Thanks
Woody "KO4BG"

19394. Re: [DrakeRadio] TR-4C - No output

Yahoo group: DrakeRadio (2014-01 — 2014-05)

From: Steve VK2SJA
Topic: 19344 Message: 19394

Morning All,

Thanks for all the replies!

Answers to questions:-

1. Yes, the transceiver/receiver side switch is set forward in the transceiver position.
2. The receiver works. It hears a 1uV marker on 7040 MHz from a Elecraft XG2 signal generator no problem at all. Re-checked this again today. Previously I grabbed a 5 watt QRP kit radio I had built (MST400) and using it into a dummy load across the room could listen to myself. Recovered audio reasonable.
3. No key plugged into the key jack. Double checked wiring on jack. Looked a little "odd" with three wires all to the same pin. But it checks out and is applying required earth with plug removed.
4. Had previously tried a couple of different bands other than 21. Today I stuck with experimenting on 7. No difference. If anything the rig has been hit with too much de-oxit! And man is that stuff EXPENSIVE over here!

and...

(Garey hits the problem on the head with Thor's Hammer - Again! :-)

5. The K2 Carrier Oscillator Shift relay is intermittently faulty!! About 90% of the time it fails to throw in properly. Looks like this is not a new fault as there are lots of scratches on the armature where someone previous has been poking it with what looks like the tip of metal screw driver.

However...

Even when it does throw in properly (assisted) I still have the same fault symptoms. :-(
So I probably have more than one fault.

Anyway first things first. Fix the obvious problem and then deal with what remains.

Couple of questions for those that know about this K2 relay;-

On the Earth side of the armature (the non contact side) there appears to be a earth solder tag with nothing connected to it or perhaps it may even be an adjustment lever??? It is held to the frame of the relay at the same point as the armature connection by a tiny brass bolt and nut. This arrangement is loose. Which allows the solder tag to rotate up and down through about 15 degrees. So can we confirm that this is indeed just a earth point solder tag and that it should NOT be loose and that I should

tighten said nut and bolt?

Not that I can see that this will fix my intermittent relay or my fault...

Next question. Any general tips for repair or service of this relay which does not want to throw in? Or should I just replace it?

Thanks!

73, Steve.

19395. Drake Manuals - K4OAH

Just to clarify, when you say a watt or so output is
that from the final amp or the exciter? If the final what
sort of readings do you get from the exciter? What happens
if you connect the exciter directly to an antenna or dummy
load after the combination quits?

Update:

Convinced that I was looking at a loose earth tag with nothing soldered to it. I have now:-

Tightened the screws holding the relay to the chassis. Which looks like the normal (and only) earth point for the relay switching. Tightened the loose brass nut. Strapped a wire jumper between earth and the previously empty tag. Now it's not reliant on the chassis earth for switching.

Checked path to XMIT K from top (diagrammatically) of K2 coil and found 16K. Circuit shows R79 10K plus R80 4.7K for 14.7K ~= 16K looks good to me.

Measured +150Vdc supply to K2 coil as 143Vdc.

Measured voltage across coil when energized as 9.69Vdc or ~= 10Vdc. What voltage should this coil be driven with?

After all this the relay is still intermittent. But it energizes properly about 80% of the time. Much improved but not perfect. If it gets stuck and I free it with tip of plastic adjustment tool then it seems to come good for a while. Pitted contacts binding the armature? Clean them?

But in all this the original fault remains.

The plate current resolutely sits at .1 idle and refuses to move upwards when the XMTR GAIN is increased even when the relay properly engages.

Off the contemplate the circuit some more.

From: M K
Topic: 19344 Message: 19402

Are you SURE that the coil is not getting at least SOME voltage when it should not??
You may want to check the voltage across the relay coil when it "sticks".
I suspect that whatever drives the coil is not working correctly, rather than the relay being at fault.

Steve -

Couple of things......

1. Is the relay 'sticking' open or closed??

2. The relay is a 12VDC coil, 1600 ohms. So your 16k is right on.

3. Depending upon the answer to 1 above, the relay should 'drop out' when the MODE switch is in
CW or AM position. This is accomplished by a set of contacts on the back of the first switch
wafer on the MODE switch, and 'opens' the relay by shorting the coil terminals. Poor contacts
here could fail to short the coil, leaving the relay pulled in. Another possibility is that the
relay armature is physically touching the magnet pole. If this occurs, the magnet may have
enough residual magnetism to 'hold' the armature after power is removed. The 'adjustment' on
the back of the armature is there to limit its travel.

A _guess_ from some 10,000 miles away, what is the actual frequency of the Carrier Oscillator
with the relay open and closed? Since it's intermittent, perhaps it was 'open' when you set the
CO frequency to ~9.000 MHz rather than 'closed' as it should have been. Then when the relay is
intentionally closed for CW, the frequency will shift DOWN 1 kHz rather than up, taking it out
of the -x filter passband.

So listen to the CO at 9 MHz on a separate receiver (or a counter if available) and make sure
that the SSB mode frequency is close to 9 MHz, and the CW mode frequency is ~ 1 kHz HIGHER.

To Garey,

Yea, I did later (really ashamed <grin>).

Boy the mail system on these groups are getting really screwy. I'm being sent these messages as if they were new posts! Now how in heck is THAT happening?

I'm sorry about that!

Hi Garey/All,

> Steve -
>
> Couple of things......
>
> 1. Is the relay 'sticking' open or closed??

Relay fails to close properly when energized. Sometimes it does not close at all. Other times it is only partially closed. By which I mean the contacts for the open position separate by a hairs breath but it fails to close the contacts on the other side for the closed or energized position.

It is like the voltage across the coil is insufficient to generate a decisive magnetic field to pull in the armature.

>
> 2. The relay is a 12VDC coil, 1600 ohms. So your 16k is right on.
>

Actually I'm pretty sure I was measuring the combined resistance for R79 10K plus R80 4.7K total 14.7K at 16K *without* the coil in series. This would mean that I am 1.3K too high in resistance for this path. I'm going to double check this in a minute. Along with what is happening to the voltage across the coil when it fails to close properly on energizing. This morning after over 30 minutes warm-up it appears to be behaving. But failed first thing when cold. Limited testing though.

> 3. Depending upon the answer to 1 above, the relay should 'drop out'...

Relay has no problem de-energizing or opening. It just fails to close reliably when energized.

> The 'adjustment' on the back of the armature is there to limit its travel.

I don't think my relay has this adjustment? Can't for the life of me see one. But maybe I don't know what I'm looking for.

>
> ...and make sure that the SSB mode frequency is close to 9 MHz, and the CW mode frequency is ~ 1 kHz HIGHER.
>
>

I have used a counter to set the CO frequency to *exactly* 9 Mhz, (as limited by my measurement capability :-) at 9,000.002 KHz. When the relay energizes properly 9,000.002 KHz becomes 9,000.962 Khz. So she is shifting UP in frequency some 960 Hz. Not quite the full 1 Khz.

Still no increase in plate current above the idle .1 point when the XMTR GAIN is adjusted upwards.

It sounds like the relay IS starved. The 143 VDC is a little low, but... The ~10 VDC you measured across the relay when pulled in 'could' account for that, but it really should be sufficient. Kinda grasping at straws here, but check the back side of the front wafer on the
MODE switch for contamination. Any 'leakage' there would act as a resistor in parallel with the
relay.

>> 2. The relay is a 12VDC coil, 1600 ohms. So your 16k is right on.

I'm not sure, just looking at the photo in the CD. That type of relay usually has a 'finger'
that rests on top of the armature to limit the 'up-travel'. If it's bent UP, it could allow the
armature to get too far from the pole piece. There is no appreciable voltage on the contacts,
so if you can bend that 'finger' down a bit to reduce the travel it might help.

OK. That's good, just checking!.

Still no increase in plate current above the idle .1 point when the XMTR GAIN is adjusted upwards. 73, Steve

Refresh control settings. SIDEBAND switch in '-x'. MODE switch in 'x-CW' Peak RF TUNE, PLATE
and LOAD controls for maximum received signal.

If you whistle into the mic on SSB do you get plate current??

If so, then measure the DC voltage on T14 (R76) in CW MODE. It should vary from 0 - 0.5 VDC as
the XMTR GAIN control is rotated clockwise. If no voltage here, check back through R74 (XMTR
GAIN control) and R75 to +150 _Regulated_ bus.

Hi Garey/All,

Another update.

> It sounds like the relay IS starved. The 143 VDC is a little low,
> but... The ~10 VDC you measured across the relay when pulled in 'could'
> account for that, but it really should be sufficient.

I think we are dealing with a combination of things that all make for a "Perfect Storm".

My relay winding when isolated only measures 985 ohms not 1.6K ohms. I'm missing 615 ohms.

My path from the relay to XMIT K is some 1.28K ohms too high. Which is nearly all in R79 which reads 11.08K instead of 10K (R80 is about 0.2K high which accounts for the rest).

My +150Vdc is low (+143Vdc) intentionally because I dropped the mains AC supply down to 221Vac (from 250Vac on wall outlet) to stop my AC3 PSU transformer from howling (saturation).

I did find that the contacts on the rear wafer Mode Switch were dirty. Inconceivable! And after all the indiscriminate aerial spraying of contact cleaner that I bombarded the rig with :-) Just goes to show that non-targeted contact cleaning is going to be hit and miss at best. Had about 4 Ohms on these contacts before iso-pro, Q-tip rub and some more contact cleaner. Now down to 0.05 Ohms and I've got about 0.04 Ohms in my test clip leads so I declare that as close to zero as I'm going to get.

In my most recent testing (limited) I've got 100% failure with 9.73Vdc across the coil when energized. Which is just enough to break contact with the NC terminal pair. Which does in fact put C84 and R141 between the crystal and ground. This raises the CO frequency 962Hz. But the Normally-Open contacts fail to close properly. They just don't make. So a switched ground signal to other parts of the circuit just isn't happening. I've not looked at the circuit long enough to try and understand what would happen with this grounding missing. But something is not going to work as it should. I'll have fun looking at this tonight.

> I'm not sure, just looking at the photo in the CD. That type of relay
> usually has a 'finger'...

No separate finger to stop upwards motion on this one. Just the contact strip of metal that runs along the top of the armature and back around to the side of the relay frame where it connects to the chassis of the relay for Earth potential under that brass nut I tightened yesterday. This

contact strip looks like it has been previously 'bent' out of shape around the rear of the armature. So this "may" serve as some sort of adjustment.

> Refresh control settings. SIDEBAND switch in '-x'. MODE switch in
> 'x-CW' Peak RF TUNE, PLATE and LOAD controls for maximum received signal.

Check (almost).

Peak RF Tune for max noise.
Sideband '-x'
Mode 'x-CW'

I'm on a dummy load and I can't hear any appreciable noise level adjusting PLATE and LOAD. So I had the LOAD control full CCW (zero position) as per the manuals tune up instructions. Not knowing what to do with the PLATE I had that set to full CCW (zero position) as well.

Even with the relay "hard jammed" in the energized position and the switches set as above there is no increase in plate current above .1 idle when the XMTR GAIN is moved upwards.

I have the nebulous beginnings of a sad theory. Perhaps a current a lot higher than normal propelled by a potential a fair bit greater than +150Vdc has passed through relay K2 coil and R79 10K via XMIT K to ground (XMIT K does switch to ground on TX right?). This current has internally melted some of K2's coil insulation. Shorting some of the windings internally. Same current cooked R79 from 10K to 11K. Combined they now make for a very 'weak' relay.

Could this have happened if she was connected to an AC3 or AC4 that let go of regulation/filtering on the +150Vdc perhaps? If so this probably does not bode well for the rest of the rig.

Anyway. Thinking my next step should be to replace R79 and see if that helps any.

73, Steve.

Steve -

Progress!

The n.o. contact MUST close for CW, it 'keys' the CO! Which is what generates the carrier.! The frequency shift you are seeing is typical.

I wouldn't worry too much about the coil resistance of the relay, YET! There have been several
different relays in that spot over time and it may be ok. I think you may be correct that the
problem is a combination of factors. If you can get the voltage across the relay to 11 VDC, and
it is STILL unreliable, then we need to talk about a new relay.

Meanwhile, that n.c. pair MUST close for CW. That point, Cathode of the CO, is grounded in SSB
via the second wafer of the MODE switch, on the front side. No ground, no CO, no CW! :-)

You don't mention if whistling in the mic produces output. Position of the PLATE and LOAD caps
isn't particularly critical for these tests, full CCW is fine.

I don't 'think' your diagnosis is correct. The +150 comes via a wirewound resistor from the +250 bus, so it is fairly reliable. The increase in the 10k resistor is not unusual just due to
age, and unless it's darkened or shows other signs of overheating, I wouldn't be concerned. It's slightly out of spec, but probably not THE problem. While you have your ohmmeter handy,
check R192 for value and condition. IF out of spec, replace with 27 ohm, 1/2W carbon comp. This is a 'fuse' to protect the wiring harness from overcurrent due to a short somewhere! What
does the +250 measure?

Yes, XMTR K is grounded to transmit. What is the voltage on T14 when set for CW as the XMTR GAIN is rotated over its range?

Afternoon Garey/All,

Nearly 2:00pm here. Lunchtime UTC +10 (+1 more for daylight savings).

First thing this morning I isolated the relay coil and started testing it with an adjustable bench power supply. Could not get it to reliably behave at 11 volts. So I pulled it out and started playing with it on the bench. I convinced myself that the problem with the relay is mechanical. It will pull-in perfectly once and then jam up for subsequent cycles. I made it much better by straightening the armature metallic contact strip that comes round the rear of the armature to the relay frame. But I could not make it behave 100%.

Given that the relay has been the source of annoyance for a previous owner. Judging by all the screwdriver scratch marks on the armature itself. I decided to replace it for the moment. So I've spent the morning grafting in a suitable +12vdc miniature relay on a small carrier board. I was able to deliberately keep all the lead dress and lengths the same so that a swap back to another genuine relay won't be hard.

Just going to break for lunch and then smoke test this new relay. Let you know what happens soon. I'm still expecting to have the same fault symptom because even when I held the relay in with a plastic adjustment tool it didn't work.

> You don't mention if whistling in the mic produces output.

I have not wired a microphone up yet. Be easier initially to inject a signal from an audio oscillator. What level should I use? I'll try and test this later today.

> I don't 'think' your diagnosis is correct.

Good! I didn't like my diagnosis anyway! <:-)

Thinking about it last night the 11K for a 10K 10% resistor is still in spec (just) so I left that alone.

Later I will check the 250vdc under load again. Will also check R192 and report back.

> Yes, XMTR K is grounded to transmit. What is the voltage on T14 when set
> for CW as the XMTR
> GAIN is rotated over its range?

Report back on this one soon.

While playing with the relay this morning I discovered something.

There is a reasonably heavy gauge wire that comes off the relay NO contact and goes back to the mode switch S2B (F) according to the diagram (F for front?). Now I'm not real good at reading these rotary switch diagrams I must admit. But something does not feel right here. What I 'think' I can see from the circuit diagram is that this switch wafer is supposed to hold earth potential on this wire for two click positions. Which is what the relay will also connect to this wire when energized. I don't know what these two positions are but I'll guess CAL and SSB. On the third click position this wire is connected to C225 *and* V13B pin 1. I think. If I'm reading this correctly which I'm probably not. But what I don't understand is that I have a direct connection to ground on this wire in three positions. CAL, SSB and x-CW. It is only in the x-AM position that I don't have a ground. This testing done with radio turned off.

Is this normal?

More later. Making progress.

73, Steve.

19414. TR7 PTO Instability

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-15 04:47:48 UTC
From: Leon Zebrick
Topic: 19414 Message: 19414

Any chance of servicing a PTO? My TR7 is jumping around in frequency, almost digital-like by about 20 hz or so. Does this about every 15 seconds. Not a general drift, but discrete small jumps, up and down. seems to get worse as the rig warms. I've isolated this problem to the PTO by monitoring the PTO output directly on a separate receiver. To further confirm a PTO problem, I isolated it from the rig by unloading its output, also monitored input DC voltages with a scope (stable). Added a secondary ground as a test - no help. I've removed the shield can and refloated all of the solder joints - no improvement. I'm up to pulling the PTO and changing components, but I'm afraid I may make matters worse. Is this a common problem with a known fix? Recommendations appreciated. Thanks.

19415. Re: [DrakeRadio] TR-4C - No output

Topic: 19344 Message: 19415

Hi All,

Grrr, I'm a complete goose at times!

My nice new relay doesn't work at all. Why? Because it only has 3 odd volts across it. Why? Because the relay coil resistance forms part of a series voltage divider with both R80 and R79. The voltage across the relay drops as the coil resistance drops. My new relay only has a 300ohm coil hence the 3 or so volts.

The good news is:-

I've learnt something! :-) And thankfully I did the mod properly so that it could be easily reversed with no wiring loom or component placement changes.

I'm at a cross-roads. If I replace R79 currently 11K with spec'ed 10K and do likewise with R80 4.7K currently about 4.9K. Then I just might be able to raise the voltage across the original relay enough to make it behave. But I'm worried. As it appears to be in poor mechanical shape. The other options would be source and replace the relay with a good working original item. Or third option is that my mod is going to have to get a lot more complex.

For the moment I'm going to sleep on it. Sorry didn't get past the relay not working to do any of the other tests yet.

I think the yoke is already grounded on the TR-7, but check that strap.

It does sound a lot like my issue from a few years ago that I had with an R-4A. The problem was a bad silver mica capacitor in the tuned circuit.

Steve Wedge, W1ES/4

At this point either the audio test with something less than 100 mV -OR- just the DC
voltage check v XMTR GAIN on T14. Just want to confirm that the audio or DC unbal current
are reaching the BAL MOD.

>> I don't 'think' your diagnosis is correct.

> have a ground. This testing done with radio turned off.
>
> Is this normal?

My schematic shows that this wire should go to C225 (to Pin 2) and C221, then C221 connects
to
Pin 1. I believe the schematic is wrong, because as shown there is no DC return on the
Cathode
of V2. I think the wire should go directly to Pin 2, and then C225 be connected from Pin 2
to
ground.

You are correct, S2B (f) means the second wafer from the panel, on the front side of the
wafer.
The positions are shown by the MODE switch drawing connected by the dotted line. Also
notice
that the 'arrow' of the grounded tag is LONGER than the others, meaning it is still
connected to
the wiper in ALL positions. The other arrows are short, so the result is that any time the
'tab' of the switch contacts a 'short' arrow, it is grounded.

So the wafer is in the CAL position, the Cathode of V5 (Calibrator) is grounded via R29,
turning
it ON. The n.o. relay contact is also grounded, along with the Cathode of V16 via R87,
turning

it ON.

When the switch is turned to SSB, the relay n.o. contact & V16 are still grounded by S2.

When turned to CW, K2 'should' pull in grounding the Cathode of V16 via R87, and, through the
MODE switch ground Pin 1 of V13 (disabling XMIT ALC) and the Cathode of V2 (enabling SIDETONE
oscillator). These are all ALSO grounded via S2, so the grounding via K2 must just be for RF
purposes, or?

In AM, K2 grounds the Cathode of V16 via R87, and Pin 1 of V13 is grounded via S2.

V2 is a strange stage, as it serves as the Detector and 1st AF Amp in receive, and as the SIDETONE generator in CW, via switching on the (r) side of S2B.

Hi Garey/All,

Some days I just don't understand the universe.

This morning I grabbed that recalcitrant relay and decided to give it another test, with a view to resurrecting it. I can't fail it. Even with only 8vdc supply the darn thing is working like a champ! Something odd. Yesterday I measured the coil resistance at some 985 ohms and this morning it is a solid 1,000 ohms. How do you gain nearly 20 ohms???

Re-installed it. Still working perfectly (for now) with 9.64v across it. For the moment have not touched either R80 or R79. Much nicer than my modern kludge. Looks like Drake meant to be there!

It will probably come back to haunt me. But for the moment let's move on.

Some overdue answers to questions:-

Junction of T14 and R76, where R76 exits CO shielding has 0 -> 0.422 vdc as XMTR GAIN control is adjusted.

Injecting ~= 1KHz tone at 70mV into microphone jack in SSB mode while also keying PTT on same jack. Result:- as XMTR GAIN control increases from zero I start to hear the tone in the speaker. Monitor function? Normal? Level controlled by side-tone? I assume you can turn it down to nothing?

However no increase in idle current from .1 at any time.

You asked about voltages. Specifically the 250vdc so here they all are again. As measured from the bulkhead feed-through caps while the radio was in RX:-

--- REAR of RADIO ---

+650 => 624v
+250 => 216v
BIAS1 => -48.3
BIAS2 => -46.4
Heaters => 11vac

(Not sure why there is BIAS on two feed-throughs but because levels were slightly different I give both).

R192 measures 29.3 ohms and condition looks very good. I have left it alone for the moment.

I don't think I've forgotten anything.

Off again to contemplate the circuit. As I've run out of immediate ideas and things to test.

Thanks again for all your assistance.

19422. R4A audio problem

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-16 01:05:04 UTC
From: <rochep@...>
Topic: 19422 Message: 19422

I have almost NO audio output from my R4A. Just replaced electrolytics, RX worked fine for a while then RX was noisy/intermittent and then NOTHING. Suspected a shot 6EH5; got a new one today and same problem. All voltages on tubes are good, the RX IS hearing signals, I can see S meter moving as I tune across band, I can peak on calibrator signal, etc... But just no sound. I DO hear slight hiss from speaker, so output transformer seems good (and resistances check out).

I did NOT replace the tantalum C173 yet, but I dont think that would cause this. I suspect Q7 and Q8. I measure 47V on the tantalum cap. For Q7 I measure 0.47V on E, 0.65V on B, and 1.1V on C of Q7. For Q8 I measure 1.8V on E, 6.5V on B, and 2.4V on C (I might have B and C reversed).

Could the volume control itself be shot? There is NO effect on this "hiss" as I turn up/down volume (or RF gain, for that matter). Is there a chart telling me expected values on Q5-Q8?

paul

Not to worry, yet.......
>
> However no increase in idle current from .1 at any time.

When you turn up XMTR GAIN, voltage on the BAL MOD (T14) is going up as it should. A couple of
things bother me here. What we have here is a failure to communicate! Lets work on 80M for
simplicity. Your measurements indicate that there should be a carrier at 9 MHz coming out of
the BAL MOD when in the TUNE-CW MODE. This signal is routed through S7 (SIDEBAND switch) and
then through the Lower SB filter, back through S7, to the NB plug (There IS a shorting plug in

the NB socket, right??) through to T6, and sent on to the Grid 0f V4. Here the 9.0 MHz CAR OSC
is mixed with the 5.5 MHz from the PTO and the resultant 3.5 MHz product is selected and on to
the Grid of V6 where it is amplified and applied to the PA Grids.

Do you have, or have access to, an oscilloscope?? Would make things easier. If not, a coax
from a separate receiver tuned to 9.0 MHz, with a DC blocking capacitor at the tip, can check
for signal through the Grid of V4, and then at 3.5 MHz at the Plate of V4, Grid of V6, and Grids
of the PA, being stronger at each point.

Those voltages are very low. They should be more like 700, 260, -60, -58 VDC and 12.6 VAC.
BIAS1 is the PA bias and BIAS2 is the ALC sample. We need to measure R45 and measure the
voltage across it in 'BIAS set mode' to calculate what the idle current really is. With BIAS1 at
-48 you may have a 'dead' PA tube forcing the other two to account for the full 0.1A, or 50 mA
each. A good check is to measure the three 15 ohm resistors and then measure the voltage drop
across them in 'BIAS set'. They should each be about 0.5 VDC so ~ 30 mA each if actually 15 ohms.
>
> R192 measures 29.3 ohms and condition looks very good. I have left it alone for the
moment.

It's a little high, which increases its dissipation. It normally runs close to 0.5W, and should
NOT be made bigger. Again, it is a FUSE to protect the wiring harness in case of a short on the
+250 bus.

You can check the DC voltages on V4 and V6.

I might be getting somewhere. I was playing around and found that if AVC is OFF, I can hear stations in AM mode only! I do NOT hear them anymore if I switch to AVC SLow/fast or even to AM. So with bandswitch set to AM I do NOT hear AM signals, but simply moving bandswitch over the AVC OFF I now hear them on AM!! They are weak and distorted, but I hear them. SOunds like my problem is in my product detector/BFO stage. But how can I hear AM with AVC OFF but not with bandswitch in AM mode?

Be no fun if it was! Well maybe...?

More answers:-

All of the following is done with the band switch set for 3.5MHz.
Previously had tried all bands. No change in fault.

>There IS a shorting plug in the NB socket, right??

Yes. There is a shorting plug in the noise blanker option socket.

> Do you have, or have access to, an oscilloscope??

Yes. I have a two scope's. 30MHz analog and 100MHz digital. Don't claim to know how to use either one properly but can give it a good try! :-)

> for signal through the Grid of V4, and then at 3.5 MHz at the Plate of V4,
> Grid of V6, and Grids of the PA, being stronger at each point.
>

Assuming I'm using the 'scope properly (big assumption). I have a good signal levels at all points in the chain until I get to the grids of the PA finals. Where I do have a detectable signal but it is nearly nothing.

Specifically:-

About 7.5v AC signal at junction R32 and R119. As close as I could get to Pin 2 V6 easily. With TX GAin at max. Complex RF waveform. Grids of PA have same signal but *really* low. About 0.5 volts at max TX gain.

Going to change fault description. You can at max XMTR GAIN see an increase on internal plate meter above 0.1mA - about 1/2 to 1 needle thickness. But you can definitely see it lift ever so slightly when TX GAIN is increased to max.

I do have a spare (supposedly good) 12BY7 driver. In fact I had already replaced this tube because I didn't like the look of the one originally in the rig. The original has sooty deposits visible on the inside of the envelope at the bottom. Which I suspect may indicate a tube gone gassy? I just now swapped back from the "new" driver to the original one. No change in fault. Two faulty drivers?

> Those voltages are very low. They should be more like 700, 260, -60, -58
> VDC and 12.6 VAC.

I can lift mains supply if you wish. Lift it too much though and the AC3 transformer won't like us.

> We need to measure R45 and measure the voltage across it in 'BIAS set
> mode' to calculate what the idle current really is.

I had done this exercise before but re-worked it again this morning. Sanity check:-

R45 is 2.2 Ohms
By calculation voltage across R45 should be 0.22 volts at 100mA (0.1A)
BIAS currently set so that voltage across R45 in BIAS set mode is 0.223 volts (close as I could get).

Internal plate meter smack on 0.1A! (Meter upside down. Radio inverted. I note the movement shifts ever so slightly when right side up).

Other news:-

Final tubes all three replaced this morning with another set. For supposedly "good tested" tubes (look like pulls to me, not NOS). No change in fault. BIAS voltage after tube change but before new adjustment was 0.180 volts across R45 in BIAS set mode. Now set 0.223 volts as per adjustment above.

15 Ohm resistors R93, R167 and R121 all replaced by me previously.

R93, 14.3 ohms, 0.395v
R167, 14.2 ohms, 0.510v
R121, 14,1 ohms, 0.395v

Voltages above are those seen across these resistors during the BIAS set function. These measurements are something of a moving target. Slow drift up. Tubes warm up and resistors heating I guess? Resistors seem to reduce resistance value as they get hot? Each time I key X-CW for a few seconds the reading is little bit different. Seems to climb then eventually plateau. The results above are my best effort at finding the plateau.

> You can check the DC voltages on V4 and V6.

Gotta take a break. But I'll get these voltages to you shortly.

Garey/All,

Stand down on the fault analysis.

I just went to key the TX using the X-CW again. The radio had been burbling away in the background for well over an hour. Getting nice and warm (hot). Guess what? My relay is back to it's old tricks. Only half pulling in. Also the main relay isn't switching over properly. The effect is that I have a tune side-tone but can still hear RX audio at the same time.

I now suspect that we have a very fundamental power supply problem which needs fixing first. After that we may, or may not, have 'other' issues. But one thing at a time.

How hot does the AC3 transformer get just cruising along in RX supply mode? Is 122'F 50'C normal?

Just quickly measured R110 and R112 and have 2.34K for one and 2.25K for the other (have not checked which is which yet). Spec says 2.5K, are my values OK?

Is this all just a case of running +250 at only +216 which causes regulated +150 to look like +140v (as measured just a moment ago)???

I'm going to lift the mains supply back up tomorrow morning and see if this helps any.

Paul -

I'm getting confused... Common problem, too many 'projects' going at one time. You have a Late
"A" CD, so the voltage chart for those stages is in the MISC directory. You have serious problems in the 'low voltage' supply to the AF and PD stages. There should be about 14 VDC across C173, NOT the 47 VDC you measure. The voltages on Q7/8 are all wrong, and at least Q8
appears 'blown'. The Base voltage of a silicon transistor can never be more than 0.6 VDC 'above' (either more + or - depending upon whether NPN or PNP) the Emitter.

You don't need to worry about the DMM anywhere in this area. I'm surprised that C173 isn't splattered all over the chassis if it REALLY has 47 VDC across it!! Voltage that high indicates
that the SS stages are NOT drawing the expected current, possibly due to blown Q's.

Check the voltages according to the chart on the CD and let me know what you get....

You should have a fairly clean sine wave at these points. If you have a counter available, check the frequency at this point. Watch out for AC and DC limits on the counter input!

Check value and condition of R36 and R40, and voltages on the Driver stage.

Sounds like you are getting 'some' drive to the PA, maybe or maybe not enough or on the right
frequency. You should see more like 150 VAC on the Grids. Again, WATCH OUT for input limitations of your scope. You should always use a x10 probe around here, and even they can be
driven well past their limitations on both AC and DC.
>
>> Those voltages are very low. They should be more like 700, 260, -60, -58

The transformer does run hot, but I would have guessed closer to 40C. Never measured one. Drake transformers in general run HOT. Have you redone the filter caps in the PS? Leaky caps
can cause high heat.

(This is one of the problems with this type of interaction. All the previous info is no longer
handy, and when you have four or five 'projects' going at a time it can be difficult to keep
them straight!! :-))

Really shouldn't 'drift'. Sounds like PA tubes are a little 'gassy', but not enough to affect
where we are now. Best to have well used tubes at this point! Judging from your voltage readings, V9 may be the gassy one.

PROBLEM SOLVED!!

This was a wierd one. C163!!! I replaced C163 a few days ago and everything seemed fine (0.47 uF on board 2 to S2). I did not hear from Garey for 12 hours (panicking!), so was looking and looking and looking. I DID work before, and now was CRAZY, I was assuming something mechanical. Sure enough, with magnifying glass on board 2 noticed that C163 solder joint was not "cold" but the trace seems to "lift off" to circuit board. So I re-flowed more solder and VOILA, all better. C173 now has 14 V DC across it.

SSB fine, AM fine, all seems fine. Only "problem" with the radio, that i have had from day 1, is that I must turn the gain WAY UP when listening to CW stations on the 1.2 kc or 0.4 kc positions (compared to when I find them scanning on the 2.4 kc bandwidth). But this can be worked on now that I have SOUND.

(Oh yeah, my original 6EH5 is fine after all!).
Thanks Gary, if you responded within 10 minutes like you usually do I would not have sat there and stared and stared and stared and ... ...

paul

Paul -

Sorry I was so slow!! :-) One of the reasons I don't replace those caps..... That broken
connection killed the BFO, so not drawing it's expected current. This destroyed all voltages
and currents in the SS stages. Still amazed that C173 didn't explode if it really had 47 VDC
across it!

Did you find the voltage chart?? Still check for correct DC voltage on V7 Cathode.

Hard to argue with success!!

Check C126 and C159, others that don't need to be replaced unless 'for cause'!

Hi Hi.

I guess I am the master of fixing things that ain't broke! Like replacing that electrolytic can for $30 when all seemed to be working fine.

Or buying the 2BRadioparts cap kit, I replaced
C91, C173, C176 electrolytics
C126, C89, C109, C163 "paper" caps

I have 3.4 volts on pin 1 of V7, good to go.
I replaced C126 in the kit and C159 is a ceramic disc, looks good to me.

Thanks a ton. I really should learn this lesson.

paul

19434. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-16 18:09:16 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 19434

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

Date: 2014-03-16 21:51:40 UTC
From: <dcoffman@...>
Topic: 19436 Message: 19436

Somewhere I have seen a 6JB6 tube matching procedure that was written by Bill Frost but I cannot seem to Google it? I have also seen another method mentioned here but I have had poor luck searching the groups since the change in the Yahoo format. I apologize in advance as I'm sure this information has been repeated here numerous times.

I just came into 14 NOS Sylvania 6JB6A tubes, adding to the 8 or 10 NOS Sylvanias that I already have as well as some Ratheons. I've heard that Sylvania's don't need to be matched but I'd like to use my TR-4Cw or preferably my T-4XC to match several sets of tubes for smiles and grins. I am using all "Off Branded" 6JB6A tubes in my transmitters; until they are dead I am keeping all of the Sylvanias set back for a time when I cannot find the "Cheap" ones. With this said, I've been using a TR-4Cw for 10 years or so and have never had to replace a 6JB6 (knock on wood); this started with a period of several months when it took me way too long to tune up as I was learning how do use the rig. I now have over 12 Drakes, a combination of TR-4,C and Cw , C, B and A line twins. All have good tubes in them but I have been hording spares. Well, realistically I have been hording radios as well, I believe it is an illness and I may need a Betty Ford addiction program.

Thanks,

Doug - N9XTF

Topic: 19439 Message: 19439

Hi everyone,

It's a very soggy Sunday afternoon here in eastern Oklahoma so spent the day working on my R4A receiver (thanks Paul (K3STX), a lot of work but the R4A is working great now). Gain was down on all bands. During a second cleaning process I found R51, 150 ohm resistor, in the Pre-Mixer "plate" that was broken in half, barely making contact. Replaced that resistor, very tight area, and receiver gain improved significantly and receiver alignment went very well..

Okay, enough of that.

I am looking for a cabinet "top" from any of the R4 receivers, they all should fit the R4A. The top I have came from an Drake SW4. It fits even with all the extra "speaker holes" that were drilled in the top, but I would like to get a correct top for the R4A.

If you have one, scraps are okay but no dents, no bends, and no extra holes drilled in the top, contact me off list, my call at yahoo dot com.

My collecting habit has been a little too severe. I have the following equipment I would like to sell. I'm listing the equipment for the Drake group before going to other outlets. Just have no room for this gear!

The equipment is:
T-4XC SN 28893 needs some TLC
T-4XC SN 30055 unknown condition. Bought it because of the high SN
CC-1 SN 368 nice condition
TC-2 SN 0068 case is scratched
TR-4C SN 36214
DC-3 SN 4800. NOS. Never used, in original box from RL Drake
RV-4 SN 17045 bought and never used. excellent condition.

I have photos of the equipment for those interested. PM me at oilieone@ cox dot net.

Thanks everyone!

Hi Garey/All,

This morning I bypassed my AC mains step down altogether. Which places about 250vac at the primary of the AC3 power supply.

This power supply has already been upgraded with a ES4AC-3 kit.

The transformer emits a loud unpleasant hum. Looking at the 250vdc line I can see initially about 270vdc. But after ~20 seconds of operation the voltage falls away rapidly and settles back down at 245vdc.

I am beginning to suspect that this transformer may well be faulty?

Only way I can think to resolve the issue is to source (yet another) power supply.

I'll take this offline until then.

Thanks for all your assistance.

Hi Garey,

Thank-you kind Sir, for you have fixed yet another Drake!!! :-) (most probably, part not replaced yet).

I decided to continue and check all thing things you suggested. And do the voltage measurements requested.

Got as far as R40 and one glance told me it wasn't right. Someone had replaced this resistor at some point. With a wimpy modern 1/4 watt resistor. It looks very stressed :-) Plastic insulation covering has run down a leg following gravity such that one resistor leg only (lower) is thinly and evenly coated with brown plastic. I've never seen a resistor like it. Black carbon pit hole showing through one side of the resistor where a minor explosion occurred. Needless to say it is open circuit.

So now to replace it. 1/2 watt carbon composition this time.

I'll let you know how I get on.

Thanks Again!

Doug -

As my Daughter used to say, "What a lucky duck"... :-)

You can 'match' them easily with any Drake transmitter. Put only ONE good 6JB6 in any socket of
the PA. Set the idle current for 30 mA. Then plug the others into the same socket, one at a time, and record the current _without_ adjusting the BIAS. Pick two, (or three,) with the closest currents and that's your matched set. Within +/- 5% is 'matched'.

If you have a more accurate meter, I would suggest you use it. OR, you can just measure the voltage across the 15 ohm Cathode resistor for that socket with a DMM, should be close to 0.500
VDC, assuming a 15.000 ohm resistor. Otherwise, record the voltage that produces 33 mA with whatever the resistor measures with the DMM.

That's how I did it recently. One tube in the same socket and measured the voltage across the cathode resistor, while idling, without changing the bias.

Cool! That will definitely kill drive to the PA!! :-) 'Modern' film resistors don't do well in that application. They can't stand the current surges, which is probably what got that one.
The weak spot in the 'film' just vaporized when a slug of Plate current hit it.

Best to replace it with an Ohmite OX ceramic composition, 1W type. A 'good' carbon comp 1/2W is
ok, but a 1W CC is too big physically.

The 'complex' waveform you reported is a little concerning, but that may clear up with a proper
alignment. Keep us posted!

Good catch!

Hi Garey/All,

> Best to replace it with an Ohmite OX ceramic composition, 1W type. A
> 'good' carbon comp 1/2W is
> ok, but a 1W CC is too big physically.

I actually had two 470ohm 1 watt "carbon" new in a plastic bag. They weren't too large so I fitted one and the radio is now making output power.

I did the cold-screen PA neutralisation which was a snap.

However not all bands have good output. Very quick test:-

3.5 = 200 watts
7.0 = 50 watts
14.0 = 195 watts
21.0 = Testing aborted because power supply started mucking up again. Relay's would drop out during tune process.

For these tests I had the AC mains back down at 220v.

So I'll wander off now and concentrate on fixing the supply issue.

A pattern is emerging. My power supply problem is most certainly related to heat. Only happens after the radio has been on for quite some time. And I'm not convinced that the fault isn't inside the actual radio itself.

Even though it tested OK I'm going to have another very long, hard look at R192 and also RFC13 and perhaps even C154. I'll try and catch it with a meter but I think my 250v is dropping off with heat.

Anyway, great progress! We now have a radio with both working RX and making good output power (on some bands at least). Still some teething problems to sort. But this patient is well on the road to recovery.

Keep you posted.

73, Steve.

The problem on 40 could likely be misalignment. If you can't get the RF output alignments to work by monitoring output or plate current, try monitoring the driver output with a scope and peaking signals that way. I've found that you can detect the small increases with each adjustment so that you can get everything to play together. The scope is much more sensitive and works to align when someone before you was in there with a "golden screwdriver".

Hi Garey/All,

> Best to replace it with an Ohmite OX ceramic composition, 1W type. A
> 'good' carbon comp 1/2W is
> ok, but a 1W CC is too big physically.

I actually had two 470ohm 1 watt "carbon" new in a plastic bag. They weren't too large so I fitted one and the radio is now making output power.

I did the cold-screen PA neutralisation which was a snap.

However not all bands have good output. Very quick test:-

3.5 = 200 watts
7.0 = 50 watts
14.0 = 195 watts
21.0 = Testing aborted because power supply started mucking up again. Relay's would drop out during tune process.

For these tests I had the AC mains back down at 220v.

So I'll wander off now and concentrate on fixing the supply issue.

A pattern is emerging. My power supply problem is most certainly related to heat. Only happens after the radio has been on for quite some time. And I'm not convinced that the fault isn't inside the actual radio itself.

Even though it tested OK I'm going to have another very long, hard look at R192 and also RFC13 and perhaps even C154. I'll try and catch it with a meter but I think my 250v is dropping off with heat.

Anyway, great progress! We now have a radio with both working RX and making good output power (on some bands at least). Still some teething problems to sort. But this patient is well on the road to recovery.

Keep you posted.

73, Steve.

19451. TR4CW keying

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-17 22:52:51 UTC
From: Gerald Eberle
Topic: 19451 Message: 19451

Hello All

I am new to this group as I recently had the chance to buy a TR4CW with NB, Speaker and PS in optically good conditions. There was sum hum on rx and keying with my Logikit CMOS-4 was not proper.

After recapping the PS with the kit from ke9pq as a safety I have still some hum coming from the transformer but had many SSB contacts with good audio reports. The PS must have been fallen down sometime outside of the speaker cabinet as there are several bends on its cabinet and also some signs on the transformer where the hum seems to come from. The hum while using headphones in cw is disturbing but I can get along with it at the moment. Keying with my CMOS-4 is still not properly working. Keying is erratic and there is no sidetone. Everything works ok with a hand key. And I made several contacs during last weekend using the mic for ptt and the audio from CMOS-4 keyer, but that makes no sense even that I can make contacts this way.

I have cleaned the relay and then noticed a black spot on the board underneath R142. The value of R142 measured around 49 Ohm instaed of 27 Ohm. Replacing it did not change the behavior of the keying. Voltage at the relays with R142 in line is about 225V, without R142 around 270V.

I like the sound of this rig very much and would like to be able to use it in cw as well.

So my question… is there anything I can do or should I go with the Universal Keying Adapter from hamgadgets.com?

Many thanks to the group in advance!

It depends on how sensitive your ears and brain are to the hum. Compared with hifi, there will always be some hum that is faintly audible in the absence of other signals.

If it's louder than that and you've replaced all your electrolytics, try changing the audio output tube (6AQ5).

A couple of questions for clarification. When you say hum from the transformer do you mean mechanical hum? If so and especially if there are signs of damage to the chassis it may be that the bolts clampling the laminations are a

little loose. Tighen them and see if the hum gets better or goes away.
Hum on CW may be coming from the BFO or from the AVC as well as the audio amplifier. First thing is to work all the chassis screws. Many grounds are mad through these screws and they often develop high resisance over time. By working them I mean loosen them a little and tighten them again. Do it a couple of times to wipe the surfaces. This trick can solve all sorts of mysterious problems.
If the hum is at power line frequency it can be coming from a tube due to heater to cathode leakage or poor heater ground return as noted above. It can also come from a half-wave rectifier. I am not sure about the TR-4CW but some other Drake rigs use half-wave rectifiers for AVC bias and IMO don't have enough filtering.
If the hum is twice the power line frequency it just about has to be coming from the main power supply. Since you just rebuilt this doublel check all the wiring, especially the grounds, and if the hum persists, check to make sure the new caps are good. Again, grounding can be a problem so check the power supply chassis as noted for the transceiver chassis and make sure the connections through the multi-pin plug are good.
Another question, and I should have asked at the beginning, what kind of headphones are you using? The headphone jack goes to the loudspeaker winding on the putput transformer and is a match for about 4 ohm speakers. If you are using high fidelity headphones with speaker level impedance, that is anything from around 4 to around 30 ohms, they will be very loud and have good bass response. They may make perfectly normal residual hum very loud. At the time this equipment was made typical headphones had impedances of from around 600 ohms to as much as 20K ohms. All of which will have a much lower level than the hi-fi phones plus mostly they do not reproduce much bass.

OK. Progress!

So it's working on the two 'image' bands, the CO mixing in V4 with PTO + (20M) and - (80M). The
other bands require V1A (BAND Oscillator) and V1B (Amp on 80/20, Mixer on other bands) to be
working. So that's the next target area.

Gerald -

Are you talking about audio hum or mechanical hum from the transformer?

The CMOS-4 keyer should work just fine by itself. That's what I use with all my Drake gear. You must use the Negative (-) keying option, the Drakes have about -60 VDC on the key and less
than a mA to ground to key.

R142 ??? R192 27 ohm, 1/2W, is a 'fuse' to protect the wiring harness in case of a short on the +250. It runs very close to it's dissipation rating, but should only drop about 6 VDC in
operation.

Hi All,

Went and had another look at R192. Placed a thin screwdriver between PCB and resistor to bend/lift it up a bit to get a good look at the underside of the resistor. It popped out of the PCB at one end - opps. I guess you call that a dry joint!

Then while fixing this by installing a new 27ohm resistor I noticed something else interesting. The very next solder pad along. Which is one of the pins from the main relay holder, was somewhat 'special'. Someone had forgot to actually solder the pin!! :-)

Fixed this too. Very limited testing but so far - no more relay drop-outs.

Power out looks like:-

3.5 - 200w
7.0 - 60w
14.0 - 190w
21.0 - 180w
28.0 - 90w
28.5 - 70w
29.1 - 40w

Did change out V1 same result. Think I shall just proceed with full alignment and see what comes out in the wash.

Very happy. Looking good.

73, Steve.

19460. Re: [DrakeRadio] L7 fixed Mica Capacitors

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-18 16:40:24 UTC
From: Jim Wiley
Topic: 19458 Message: 19460

Check VERY carefully the wiring of the band switch! I had an L7 where the output section of the band switch was mis-wired from the factory, with the symptoms that the L7 would not load on 160 meters. The additional loading capacitors for both 80 and 160 meters were not being connected properly. On 80 meters operation was marginal, but it worked after a fashion, not so much on 160. Once the wiring was rearranged so that the auxiliary loading capacitors were switched in as they should be, the amp worked as advertised. The wiring looked OK at first glance, but after staring at it a while, the error was apparent. The clue was that the amplifier capacitors "tuned" well outside the indicated arc on t\he dial.

Garey and the group,

I know a lot of hams speak well of the Shure 444 (I have one of the HRO branded 444's). I also have a CB44 handheld which, like the 444, is also a controlled magnetic mic with hi-Z and low-Z wiring options. Do you feel the same way about most of the Shure controlled magnetic mics as you do about the 444?

73,

Bill, WA6NEQ

I don't think the TR-3 had individually packaged crystal filters. The TR-3 has a "soup can" that has both filters and the sideband switch in it. I don't know what the insides of that soup can look like, though.

Bill -

I'm a CW guy, so I'm not really one to ask! :-) Richard Knoppow or Jim Shorney, among many others, are far more qualified than I regarding microphones! Shure mics in general are good quality and have decent 'sound'. So much depends upon your individual voice characteristics too.

MY test for a mic is to talk to a friend who has talked to me in person. If they say 'it sounds
like you', then I'm happy..

I would just post to the list and see what surfaces!!

Bill,

I have used all of the following with good results:
* 419A (HiZ hand mic), 419B (LoZ hand mic),
* 444 (HiZ), 444D (switchable LoZ/HiZ),
* 404B (LoZ hand mic), 404C (HiZ hand mic),
* 520SL (HiZ)

Hi Bill,
After being off the air for awhile, i put my old Sure 404C back to work with my T4XC. I still get very good audio reports.

19466. Element for Turner 22x mic

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-18 21:42:50 UTC
From: Robert Spooner
Topic: 19466 Message: 19466

I acquired a turner 22x microphone along with some other equipment. The element is dead, or nearly so. I'd like to replace the element and use the mic; it came with a nice Electrovoice grip to talk stand. Does anyone know where I can get a new crystal (or ceramic) element for it?

73,
Bob AD3K

19467. T-4XC idle current - finishing restoration

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-18 23:45:09 UTC
From: <dcoffman@...>
Topic: 19467 Message: 19467

I am finalizing the restoration of my first C-Line; prior to putting the cases back on the transmitter, I decided to check the screen and grid resistors. I replaced R53 and R54 as they were 16.0 and 16.75 ohms each and R50 and R51 as they were 74.01 and 74.70 ohms respectively.

For smiles and grins, I measured the voltage drop across R53 (.402) and R54 (.507) in tune mode. R53 is 14.83 ohms and R54 is 14.85 ohms. This gives a current draw of 27.11 mA + 34.19 mA = 61.3 mA total. Now the first question is, is the current mismatch going to cause a significant issue, 20.7% variance seems quite high. Secondly, I have the bias set for 70mA, is the 61.3mA close enough or should I muck around and try to make the meter agree with my measurements?

Thanks,

Doug - N9XTF

19468. Re: [DrakeRadio] DRAKE TR-3 USB FILTER

Yahoo group: DrakeRadio (2014-01 — 2014-05)

Bill-

The TR-3's had two types of 9.0 Mhz filters. Earlier TR-3's (and some early TR-4's) had the "soup can", which was a dual 4-pole filter (LSB, USB) that used discrete HC-6/U sized crystals with wire leads. The crystals were soldered inside the tin can, along with some dipped silver mica capacitors.

Later TR-3's had a sealed, dual filter that replaced the soup can style. I do not know anything about the properties of this sealed filter assembly, however it appears to have a little steeper skirts than the soup can style.

Byron,

That's interesting. I had read that TR-3's have the soup can and the first versions of the TR-4 also had the soup can. I thought the second versions of the TR-4 had the sealed dual filter. Starting with the third TR-4 they went to the two sealed filters.

I wasn't aware that Drake used the dual sealed filter in a TR-3.

Thanks for the info.

19478. Re: [DrakeRadio] DRAKE TR-3 USB FILTER

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-19 01:55:51 UTC
From: Garey Barrell
Topic: 19428 Message: 19478

I've never seen a TR-3 with a sealed filter. The TR-3 had the soupcan, as Byron described. These were four pole filters with pretty wide skirts. This went into the early TR-4s as well.
The sideband filter was changed to a 6-Pole hermetically sealed unit manufactured by TYCO at
around s/n 18,000. The next change came around 24,000 and was the two separate 8-pole filters
that carried through to the end of production.

Anything outside these ranges is probably a factory modification. The soupcan was fairly reliable, but wouldn't come close to meeting the FCC 'Purity of Emissions' regulations of today. It seems like there have been a rash of failures lately, mostly on the LSB filter.

19480. Re: [DrakeRadio] T-4XC idle current - finishing restoration

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-19 02:22:49 UTC
From: Garey Barrell
Topic: 19467 Message: 19480

Doug -

Not good. This is part of the reason for 'matched' PA tubes.

For best linearity, (important,) the PA tubes should be matched so that each draws 35 mA of Plate current at idle. These tubes are being operated at their maximum capability, and if one is
a little low, the other has to make up the difference to equal the nominal 70 mA idle current.
This current is important, because it sets the operating point of the tube at the most linear
(low distortion) point, and if one is at 27 mA and the other is at 35 mA, only one is truly 'linear'.

The Cathode resistors should be within 5% of each other and the PA tube current at bias should
be as close as you can get them for best linearity. Tubes can be 'matched', by inserting them
one at a time in the same socket of the transmitter, setting the BIAS for 35 mA for the first,
hopefully 'good' tube. Then insert how ever many you have into the same socket, and record the
current drawn by each one without changing the BIAS voltage. The two that are closest together
in current are your matched pair.

61 mA is too low, for all the reasons stated above. The 'Test select' resistor (R13) is selected to make the meter read 70 mA when the actual current is 70 mA. If the shunt resistor
has changed value, you may have to change it to get R13 'in range'.

Regarding sealed filters in TR-3:
I have had about 3 or 4 of the TR-3's with the dual sealed filter pass through my shop. There were 2 different styles of the filter as evidenced by the ones in early TR-4's.
Thanks, Byron

19484. TR4 CO Alignment

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-19 04:23:26 UTC
From: Steve VK2SJA
Topic: 19344 Message: 19484

Hi All,

Now contemplating a full alignment of the TR-4C. One of the first alignments off the cab-rank as it were is the Carrier Oscillator. Currently it is set bang on 9Mhz by counter.

The manual suggests adjusting C130 while switching back and forth between LSB/USB until the observed sound "pitch" or tone is the same, while listening to band noise.

My ears aren't that good. And even if they were my mind play's tricks!! (Was that an ET signal in the white-noise???)

Is there a better way?

Assuming that the filters are both "good", a search of the archives found a suggestion by Richard WB6KBL, to unbalance the 'Balanced Modulator' and adjust the carrier for equal strength on both sidebands using a 'scope. On the assumption that the filters are good this makes sense to me.
Question:- What is best/easiest way to totally unbalance a TR4 balanced modulator?

Anyone got an even better method?

73, Steve

You might experiment with using an audio spectrum analysis program, such as Spectrogram. Spectrogram is available for free download from the Elecraft web site, www.elecraft.com.

Such an analysis will let you balance the "sound" of each sideband, which is probably what you are wanting to obtain. Use a broadband white noise generator, schematic also available from the Elecraft site, to inject a signal into the transceiver. In fact, they have several reasonably priced test equipment items in kit form that might be of interest.

Note that the free version of Spectrogram they have on their web site is not the latest version,but it will serve well for this application. It works with your laptop and sound card to develop a graphic display of the audio response. Additional technical assistance is available from other users on the Elecraft reflector.

Elecraft's "builder resources" page on their web site lists the Spectrogram download as well as articles on it's use.

Hello, I recently purchased another L4B which works Great and Looks good to better. On the control knobs it has the normal wording, "Load, Band and ---" there is no lettering under the Plate knob, I had never seen one without it, my other L4B says Plate under the top most knob. Is this a Older version or Later or a slip up, you can tell that it was never there, also has 10 mtrs on it and tune input slug, which my other has a blue dot in the 10 mtr spot and no 10 mtr tuned input slug.

19488. RE: [DrakeRadio] T-4XC idle current - finishing restoration

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-19 12:13:43 UTC
From: Doug Coffman
Topic: 19467 Message: 19488

Garey,

I’m using a pair of Ratheon 6JB6 tubes that were supposed to be a matched pair, go figure! You had posted to my response regarding matching 6JB6 tubes and I will proceed with that. I was hoping to use these tubes for the duration of their life before dipping into my Sylvania stock! I went through 12 Ohmite resistors to find a set that were matched for the cathodes, there is a pretty big variant between them; they are 10% however so not too surprising? I will match a set of tubes and put them in place; thanks for the information.

By shunt resistor, I’m assuming you are referring to the meter shunt resistor? Would it make sense to correct the meter shunt resistor if it is out of tolerance first and then change the test resistor following that to correct the reading?

Thanks for all the help,

Doug – N9XTF

From: DrakeRadio@...m [mailto:DrakeRadio@yahoogroups.com] On Behalf Of Garey Barrell

Subject: Re: [DrakeRadio] T-4XC idle current - finishing restoration

Doug -

Not good. This is part of the reason for 'matched' PA tubes.

For best linearity, (important,) the PA tubes should be matched so that each draws 35 mA of Plate current at idle. These tubes are being operated at their maximum capability, and if one is
a little low, the other has to make up the difference to equal the nominal 70 mA idle current.
This current is important, because it sets the operating point of the tube at the most linear
(low distortion) point, and if one is at 27 mA and the other is at 35 mA, only one is truly 'linear'.

The Cathode resistors should be within 5% of each other and the PA tube current at bias should
be as close as you can get them for best linearity. Tubes can be 'matched', by inserting them
one at a time in the same socket of the transmitter, setting the BIAS for 35 mA for the first,
hopefully 'good' tube. Then insert how ever many you have into the same socket, and record the
current drawn by each one without changing the BIAS voltage. The two that are closest together
in current are your matched pair.

61 mA is too low, for all the reasons stated above. The 'Test select' resistor (R13) is selected to make the meter read 70 mA when the actual current is 70 mA. If the shunt resistor
has changed value, you may have to change it to get R13 'in range'.

Woody,
I am sure that a guru will get back with you but this subject came up as I recall last year (2013).

In that reference the conversation was NONE of the knobs were marked. The final answer was to x point did and then they didn't.
Missing one set of lettering sounds like perhaps they were running out of labels maybe..?? Carl wd8nhk

I got my L-4B new in 1979 and it was missing the 10m input coil/cap set and had a gray dot over the “10” at the band switch and load positions where they should have been. Drake provided me with the 10m input circuit to install and I very carefully rubbed the dot with a pencil eraser and found the “10” underneath the dabs of paint.

This rock solid box still working FB after all these years (power supply rebuild of course)…although I recently replaced the 3-500Zs and repaired the filament tube socket pin on one bulb where the spring clip had deformed over time and lost its “springiness” - this led to overheating of the pin and a slight reflow of the solder in the pin. After replacing the clip with one from a spare socket and carefully reflowing the solder pin and adding a bit of silver solder hopefully that issue is resolved.

Next time you have your L-4B open for maintenance check all those socket pins….it will be apparent if you have a problem and well worth fixing as a preventative measure.

If anyone wants a little more info let me know and I’ll send along a short paper describing the issue along with some pix that I put together for my club.

The TR-3's had two types of 9.0 Mhz filters. Earlier TR-3's (and some early TR-4's) had the "soup can", which was a dual 4-pole filter (LSB, USB) that used discrete HC-6/U sized crystals with wire leads. The crystals were soldered inside the tin can, along with some dipped silver mica capacitors.

Later TR-3's had a sealed, dual filter that replaced the soup can style. I do not know anything about the properties of this sealed filter assembly, however it appears to have a little steeper skirts than the soup can style.

First of all if you don't have Garey's disc for the
TR-4 get it!
The TR-4 uses the same filters for receiving and

transmitting and the same carrier oscillator is used for both. The book method for setting the oscillator is to listen to noise on receiving. Tune the set to an unused frequency. If there is enough noise with the antenna detached use that and balance the sound as best you can. A meter across the speaker may help. The idea of adjusting in transmission is based on the assumption that the slopes of the fliters are identical. Tune everthing up on a dummy load. Unbalance the balanced modulator with the variable resistor to get enough carrier to see on a scope. It may not need to be fully unbalanced. Then adjust the oscillator frequency trimmer for the same level when switching from one sideband to the other. When you get them the same re-balance the modulator. When you check fore the pitch of the noise in receive it should be about the same. I say about because the two filters may not be exactly identical and the ear is pretty sensitive to small variations when directly compared. If you have an auxilliary receiver with a wide pass band listen to your own signal using good headphones, again you should hear little difference between sidebands although there may be a little. Make sure you tune the test receiver very carefully, you can hear slight mistuning this way that you would never hear on a normal signal.

> Hi All,

I always forget something. A counter may be useful for
approximate setting of the carrier oscillator but its exact
value depends on the filters in the set so don't try for
extreme precision. The exact frequency for best response
will vary a little from set to set.

Steve -

UNbalancing the BM is not the way to do it. That procedure was written for the 4 pole filters
in the TR-3. With the 8 pole filters in the later TR-4/C, you can't unbalance it enough with
the BAL pot to register.

The idea is that the filter passbands are roughly the shape of the letter "M". The CO sits in
the trough in the middle, and the USB and LSB audio passbands are the peaks on either side. If
the CO is too far one way, the audio of that filter will be 'muddy' or 'bassy', and the other
will be 'hissy' or 'shrill'.

An audio spectrum analyzer such as Spectrogram on your computer will work if you have a noise
source. The source can be as simple as a Zener diode that is starved for current.

You can check the placement by tuning through the Calibrator signal, and plotting the response
at some arbitrary S-Meter reading below the peak. Say your CAL signal is S-9 +10 db. Tune from
outside the highest tone, and tune toward zero beat. When the signal comes up to S-9, count the
audio frequency. Tune on through the peak until the signal drops to S-9 again, and count the
audio. The space between these two spots should be about 2.4 kHz or so, and the frequencies
counted will be the passband 'edges'. It SHOULD be roughly 300 to 2700 Hz. Then tune on
through Zero beat and up the 'other' side. Ideally you'll get the frequencies of about 300 to
2700 Hz. If not, tweak the CO until the two passbands are approximately equal.

Yes, R59 is the shunt. An Ohmite OX would be great, or a 'flameproof' (wirewound). These hold
their value MUCH better than the carbon composition types. Worst case a 1W CC would be ok.

As to your question, it would be best to replace it. But it's probably not going to drift too
much higher, and if the selected resistor (R59) can compensate it's probably ok.

OK. I suspect those were retrofits. The soupcan wasn't too reliable early on.

The soupcan was used through the first 1500-2000 TR-4's before the sealed unit appeared. Doesn't seem likely that they had them during the TR-3 production? Maybe they were too optimistic on the first contract with Tedford for the soupcan!?! :-)

I decided to try this in practice. I did not use a scope but could hear the carrier on an adjacent receiver while transmitting into a dummy load. The carrier is quite loud enough to make adjustments BUT, and its a big one, the carrier frequency changes of course as one adjusts the carrier oscillator. That makes it a problem to judge any variation in carrier strength. Because the frequency is changing, although slightly, it moves the signal around in the receiver passband so one has to repeak. A bother. I compared a careful adjustment made by listening to noise on the TR-4 receiver with adjusting by looking at residual carrier with the BM unbalanced using the balance pot: result is about the same but judging noise is easier. I did do this adjustment in the past using a scope and it did work. Even though the residual carrier through the sideband filters is low it was enough to get a balance. My TR-4 has, I think, the 8 pole filters. The serial number is high enough and the filters are oblong cases painted blue. The performance in receiving is very good. I compared quality of transmission as best I could using the widest band on my AR-88. This is about 14 khz and quite flat. With the suppressed carrier centered there is no audible difference in quality between

the two filters. Unfortunately, the only microphone I have with the correct connector for the TR-4 is a D-104, which is somewhat shrill sounding. My T4XB was modified (by someone else) to use a conventional 1/4" plug and all other microphones are set up for this plug.
So, FWIW, although I used the residual carrier technique in the past to set the carrier oscillator the book method using the receiver seems to work fine. I suggest using a pair of high fidelity headphones to listen on although I had no trouble with the MS-4 speaker.
I used the same technique on my T4XB, which I think also has 8 pole filters, and it seems to work.
A brief additional note: if the carrier oscillator is adjusted at all do a carrier balance when finished because even a slight change in CO frequency will upset the balance. The BM in both the T4XB and TR-4 are excellent and have virtually complete nulls when balanced. I used the adjacent receiver to listen for the null. It goes right into the noise.

Many thanks for all the input!

I will give you some feedback on your remarks and tips…

- Hum
Yes, I am using Koss headphones with a good and very loud bass response.
I have tighten most of the screws in the PS and TR4 and the screws on the transformer are as tight as possible and I don't want to go further with them as I am afraid off breaking them. The PS must have fallen on one corner from quit high outside of the cabinet, so I think there is some mechanical hum. What puzzles me is, that the hum is not amplified by the af-amplifier. But going that loud to overcome the hum will kill my ears definitely ;-)

- Keying
As I wrote before, with a hand key sidetone on the TR4 and the signal in a separate rx sounds ok.
So I had a look at the cmos4 and compared my original schematics with the newest one. There are differences and updates published and mine seems quit old.
Now as a start, after changing 2 resistors in the output circuit the cmos4 keys the TR4 fine and the sound on the separate rx is as with the hand key. But the sidetone is horrible choppy! It seems, that the cmos4 is not switching the 25v down to 0. As I have no other suitable keyer I will try it with a keying adapter.

Yes it was R192, not R142, that I have replaced and I will measure the +250V again and also test the wiring between the PS and TR4.

Richard -

I have rarely been able to get enough CO to move the Plate current meter on any of the later
transmitters/transceivers, (8-pole, separate filters,) even with BAL pot turned all the way
either way. It works fine on the soupcan filter rigs, and even the sealed 6-pole filter used
in the early TR-4s. Certainly a scope or receiver is sensitive enough to allow comparing the
two. The audio counter method is educational as well! :-)

Gerald -

There is no reason the CMOS4 should not key the Drake transmitters. The output is a 2N2222 transistor, which should pull the keying voltage down to ~ 100 millivolts. The TR-4C can be keyed with a finger across the key terminals, so if your keyer won't key the transceiver, it
probably won't key a keying adapter either! It's possible that you are getting RF into the keyer via the paddle leads. If those leads are unshielded, that's where I would start. RF chokes right where the keyer leads enter the cabinet may be necessary.

Measure the voltage on the key jack when keyed by the keyer. If more than 150 mV you may have a
bad keyer transistor or resistance in the internal jumper that selects between + and - keying.
Or possibly a leaky D1 diode. Other potential trouble spots would be a sketchy V2 or V6.

OK I think we have the clue about out difference. I
was not using the plate current or output but rather a
sensitive scope on a T splitter going to a dummy load (for
the original measurement) and listening to the spill over
from a dummy load on a nearby receiver. Either will respond
to very small signals. For adjusting the CO the scope is
better because of the change in frequency but for adjusting
the carrier null either will work with the edge going to the
receiver. I did not think to look at the plate current. I
don't have the TR-4 set up at the moment. I put it on line
instead of the B twins in my so-called shack. I just got
curious. I am sure I have the 8-pole filters in mine. I wish
my R4B had as good selectivity.
I can see where I must re-investigate this. As it
happens I am on vacation at the moment and my lady friend is
out of town so I can do it.
In fact, I have no trouble finding the sweet spot per
the book instructions despite having very poor hearing.
Also, BTW, these adjustments seem to be very stable.

It could be any number of folks who have worked there over the years. Most of the Turner inventory has been gone for many years, before my time there. A likely suspect may be Evan Haydon, N0GMR. There was someone else up closer to Omaha that had some stuff too, but I don't know who he is.

Hi Steve.

> Anyone got an even better method?

I mentioned the method I used (in this forum) a while back when I was bring my TR-4 back to life. It does assume access to a modulated signal source.

What I did was set my (HP) RF signal generator to a frequency the TR-4 could receive and set it to AM modulate at about 700 Hz. With this, I simply switched between upper and lower sideband until the sounds were the same. (It is pretty amazing how most folks can tell even a slight difference.) When the two were the same, I knew the adjustment was as good as it was going to get.

With the audio spectrogram, it should even easier to actually see the difference. As long as the signal was modulated with a sine wave, I expect you could even hook a frequency counter up the to speaker output and check the frequency.

Back in the woodwork.

19509. Bandswitch mushiness

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-19 23:12:44 UTC
From: Steve Wedge
Topic: 19509 Message: 19509

I fixed the mushiness of my T-4X's bandswitch. Here's what I think caused it and how I fixed it.

On the T-4, T-4X, all TR-3's and TR-4's, as well as all the 4-Line receivers, you'll notice that the detent assembly is at the rear of the set. (The B-Line and C-Line transmitters have the detent at the front, so some parts of this discussion may not fully apply to it, but they're similar). I believe the detent problem I had could have been caused by shipping damage: the knob may have been pushed from the front hard enough to bend things in the back. I see no damage to the front panel, however, so who knows? The detent plate that screws into the back of the chassis should be absolutely flat, but it more resembled a potato chip! The circular piece of spring steel inside also was not bearing down enough on the ball bearing due to some bending in it and in the tabs that align it.

The detent assembly consists of five pieces, plus the mounting screws. From the rear, the circlip mounts in the groove to keep tension on the spring washer and plate assembly through the ball bearing and onto the detent plate's detents. The ball bearing is held in place laterally by a groove in the shaft plate. The plate doesn't come off: it appears that it was originally mounted to the shaft from the "front" side, then the shaft was crimped to prevent its sliding toward the front. When you turn the bandswitch, the ball bearing rides over a "hump" on the detent plate and rests in the "valley" between these humps at each band position. There are additional raised areas that prevent the bandswitch from travelling beyond the limits of the six band positions. The detents are felt when the ball falls into each "valley", keeping the bandswitch wafers centred.

If the tabs on the shaft plate get bent in the wrong direction, you'll not have enough tension on the ball bearing. If the detent plate is warped, you won't have enough tension on the ball bearing on some positions. If the spring "washer" is bent, you'll lose additional tension.

The trick is to carefully bend everything back to original. The detent plate must be flat, as does the spring "washer", when it's not under tension. Note also that the washer's holes are not centred: the shaft plate has pins on two of the tabs that must rest in those holes in order to hold it in place. Once assembled, spring tension holds the whole thing together.

To check and repair the assembly, do the following:

1.. Put the bandswitch to somewhere in the middle (7.0 is good on the T-4X). Push the bandswitch from the front of the set to remove tension from the circlip and remove the circlip from the groove at the rear of the shaft. The circlip is not spring steel but appears to be of soft metal that can be re-bent back when you reinstall it. Remove it from the back of the shaft using a screwdriver, being careful not to lose it.
2.. Mark the position of the detent plate to the chassis by drawing a line with a Sharpie on the plate and chassis. Trust me on this Remove the two mounting screws and pull the detent plate off the shaft. The ball bearing may fall out at this time. Keep everything in a cup as you take it apart.

3.. If it hasn't fallen out already, remove the ball bearing from its resting place in the slot of the shaft plate. You can now pass the shaft plate and spring washer through the hole in the back far enough to access the tabs with needle-nose pliers or screwdrivers, if necessary. From my observations, you'll be hard-pressed to get the entire rear portion of the shaft out. I suspect the Nylon bevel gear is glued on. Sure seems that way. You won't need to remove the whole thing anyway.
4.. Note where the spring washer is mounted onto the shaft plate. The shaft plate has two pins that engage the two holes in the washer. Note how the four tabs of the shaft plate are in relation to the washer: the washer is toward the front of the radio on the tab opposite the ball bearing and is toward the rear of the radio at the two pin locations. Remove the spring washer and check the tabs of the shaft plate to make sure they're not excessively bent and bend them back if needed.
5.. The spring washer should be flat when removed from the switch. Correct any bends.
6.. The detent plate should sit absolutely flat to the chassis. place it over the shaft and check for flatness without the spring washer in place. Bend any areas that are not flat so that it sits flat to the chassis.
7.. Everything should now be ready to reassemble. Place the spring washer back in position on the shaft plate, so that it is toward the front of the set on the un-holed tab and such that the pins in the shaft plate engage the holes in the washer. Turn the shaft so that it's 7.0 position. The slot of the shaft plate should be at 3 o'clock as viewed from the rear. It's important that the bandswitch is at a known position within its expected range of travel.
8.. Put a dab of general-purpose grease on the ball bearing and insert it in the slot of the shaft plate and against the rear of the spring washer.
9.. Install the detent plate on the shaft and be sure that it's aligned with the mark you left previously. Press onto the chassis and re-mount with the two slotted screws.
10.. Make sure the spring washer is still engaged in its holes and the ball bearing is still in place. Whilst pushing the bandswitch from the front of the rig, reinstall the circlip into the groove in the rear of the shaft and press back together with pliers.
11.. Test the bandswitch. It should stop with the pointer at either the 1.5-3.0 (Twins) or 80 (TR-3/TR-4) at CCW stop and the 28.5 (Twins) or the third 10 position at CW stop. Each position should have a clear detent and the switch wafers should be in their correct positions. If this is not the case, either the detent plate is 180 degrees out of position or it was installed with the shaft 180 degrees out of position.
Operation of the bandswitch should be close to normal. Mine is still a little lighter than "new" condition but is much improved.

This was a classic case of some mechanical sleuthing and application of good ole common-sense.

Not having a C-Line handy, I can only guess that the TR-4C appears to have a rear-mounted detent

Hello folks.

Just wanted to let you all know that I have only two DDS VFO boards left with no immediate plans to purchase any others. One is fully populated and up for sale on eBay. The other is just a bare bones board.

FYI - here's a couple of pictures of a DDS VFO that I just built for my TR7, just to show how easily one can be constructed. It's a 'plug and play' device.

http://www.k3jls.net/tr7_controller.html

The same technique could be used for virtually any digital display equipped radio using a 5 to 5.5 Mhz VFO.

If there is any interest, please e-mail me at k3jls@verizon.net

19515. WTB: Original manual for Drake TR7

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-21 13:31:56 UTC
From: Joe W2KJ
Topic: 19515 Message: 19515

Howdy Fellow Drakesters:

Just bought a TR7 and would like to buy an original manual for it.

Anyone have an extra manual that is excess to their needs??

Many thanks.

73, Joe W2KJ
TR7, TR4CW/RIT, C-Line

19516. RV7 Remote VFO Question

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-21 17:59:09 UTC
From: Leon Zebrick
Topic: 19516 Message: 19516

I have a problem with the PTO in my TR7 and I'm wondering if a salvage PTO from a RV7 would serve as an exact, drop-in replacement. I'm considering an RV7 for this purpose, then building in a DDS into the vacated RV7 housing.
N5LAZ

19517. WTB: Six Drake 2C/2NT Knobs

Leon -

I don't know for certain, because I've never tried it. The PTOs are electrically identical, and I can't see any reason why the mechanics would be any different.

My question is, WHY? PTOs are generally extremely reliable and relatively easy to fix. A LOT
of problems can be traced directly to mechanical or soldering problems. They are easy to access
and work on. ??

Garey, I first noticed my PTO problem when monitoring CW. Intermittent frequency jump of about 20 hz or so. Sometimes back and forth in frequency, several seconds between. Seems a little more pronounced with a well warmed radio. I have been through the PTO. Cleaning, lubrication, ground strap inspection, very close visual inspection of each solder joint, then retouching each one. Nothing noted in visual. No change with refloating all those joints. I monitored the PTO directly with a secondary receiver to confirm it as source. With PTO operating (shield off) and while monitoring its beat note on a secondary receiver, I attempted to find a mechanical issue poking around with a long non- conductive tool. Nothing found. The PTO is super clean, springs in place, and very smooth mechanically. I suspect a component, but I have no idea which. Someone has related a similar problem, claiming a silver mica capacitor, but they do not
remember which one it was.   I'm open to shotgunning, but it might just be easier to find a salvage unit.

Leon -

Possibly..... they can be difficult to dig out. Have you monitored the +10 VDC across the Tantalum cap? A scope or DMM here and/or on the RIT line (terminal out the side of the can) might correlate.

If you trash it, I'd like to have it to troubleshoot.

The Tantalum is shielded by the 100 ohm resistor. FETs sometimes exhibit this behavior as well. Check Source voltage.

We have two different objectives Leon.... I want to know 'what' and 'why' it failed, you just
want your radio to hold still!! :-)

Date: 2014-03-21 21:36:15 UTC
From: Joe W2KJ
Topic: 19524 Message: 19524

Howdy Fellow Drakesters:

I recently purchased a TR7, PS7, RV7 and MS7 from Garey, K4OAH.

He described the units as being in excellent condition.

What arrived are units that are in MINT condition and all working FB.

Most folks overrate their gear...Garey does not.

If you buy something from Garey it will be as described or better, work FB and be a good value.

I'm enjoying the new Drake gear and want to thank Garey for selling me such fine equipment...many thanks Garey.

The PTO is exactly the same in the RV7 and the
TR7 but before you do that have you disconnected
the RIT wire on the PTO to be sure that there is
not a minor voltage change in the RIT circuit causing the frequency change?
The radio will function fine with the RIT wire
unhooked. There is an MC14016 chip on the parent
board that steers voltage for the RIT circuit and
they sometimes get flakey and that could cause the problem.

19529. TR-7 parent board tantalum cap

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-22 01:07:31 UTC
From: <mark@...>
Topic: 19529 Message: 19529

My TR-7 was starting to behave strangely and since it had been a couple of years since I had done the pull the boards, Deox and reseat routine, I figured it was time. Upon visual inspection, I noticed that one of the two tantalum caps on the bottom of the parent board had one of its legs blown off. Other than the tantalum being near an IED, what might be a cause for this?

From: Steve VK2SJA
Topic: 19344 Message: 19531

Hi All,

A very big thank-you to everyone that replied! It was very educational.

I decided to go with the audio-spectrum sweep idea to align the filters. Having started by positioning them by ear as best I could.

It took a day or so to collect, setup and learn how to use the required software. I'm using Linux this way. So at first I looked at Baudline

http://www.baudline.com/

This is some seriously powerful software. But it's complexity beat me initially. So then I found a Python program written by pa2ohh. Python runs happily under Windows or Linux. The program is called (not surprisingly) "AUDIO SPECTRUM ANALYZER".

http://www.qsl.net/pa2ohh/11sa.htm

It is not nearly as powerful as Baudline but by keeping things simple and because it was written by an Amateur with sweeping crystal filter responses in mind. I was able to get this to 'fly' pretty quickly.

I have uploaded a two screen snapshots into the photo area of this group under the Album VK2SJA. One photo of a sweep of each filter. I called the filters 'X' being the Sideband 'X' position on the TR-4C. And the other filter I called 'Y'.

From these sweeps I can see that I am close but there is room for improvement. I was also a little surprised by the amount of ripple apparent in the passband.

Anyway if anyone wants to have a look at the photo's and make comment I'm all ears.

Thanks again everyone. Learning new tricks all the time.

However I've hit another 'snag' in my TR-4C restoration process. So further tweaks of the CO will have to wait for the moment. I'll cry for help in another post. :-)

73, Steve.

Leon, you need to do as Joe suggested and check the 4016 on the parent board. This is a known issue. These ICs are strange beasties and can fail in some odd ways. It is in circuit whether the RIT is on or off. If you don't eliminate it first as the source of the problem you may have the same problem with a replacement PTO.

19533. TR-4C Alignment. Bad 28 28.5 29

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-22 04:44:12 UTC
From: Steve VK2SJA
Topic: 19529 Message: 19533

Hi All,

Well I have hit another road-bump on the way to restoring my TR-4C to full health.

Started the 'Alignment' procedures today. Quickly discovered why I have low TX output on the 28, 28.5 and 29.1 bands.

When doing the "5-10 INJECTION CRYSTAL OSCILLATOR" adjustments everything was fine until I hit 29.1 MHz. While doing the adjustment (having to do it with a DMM) I notice that the voltage was *positive* not negative!

I then discovered that the Crystal Calibrator signal on these same bands is *severely* distorted! Things are far from linear somewhere!!

Any ideas for where I should start looking?

Thanks!

73, Steve.

Correction.

On 21 I also have slightly distorted crystal calibrator tone. Not nearly
as bad as 28, 28.5 and 28.

100KHz marker tone sounds fine on 3.5, 7 and 14.

I can't add much either. Communications mics are not
high fidelity, they are supposed to maximise intelligibility
of signals under noise conditions. See what sort of signal
reports you get. The variable reluctance or magnetic
mechanism used by Shure is very reliable and rugged, not
sensitive to heat or being dropped. Shure is still in
business. I think they have a collection of data on
discontinued mics on their web site.

Thanks Guys for the reply on the Capacitors
I will check the wiring again , the schematic didn't show the switch positions very will . was
hard to follow.

I don't know if they are all bad , most likely not , Just seems like if I have it apart change all three if I find some and they are to expensive .

I got at the area by taking the part of the tank coil out on top of the band switch , was that the correct way or is there a easier way ? taking the bottom off would require taking mounting screws off the plate, loading capacitors and tank coils etc.

I cannot find these two caps in the service manual. I can see them in the photo of the underside of the parent board, but I don't see them in the schematic or in the parts list.

The tantalums are from the top down; brown, black, blue. I don't see a multiplier dot. They have a green stripe down on side. I'm guessing 10uf 5% @ 20v? Am I close?

Are these intended to be bypass caps on the 10v return?

An AC-4 is an AC-4 is an AC-4. And almost an AC-3.

The little 6-32 threaded feet on the power supply are actually what holds it into the cabinet. Simply unscrew them, slide the supply into your MS-4, and re-install the feet through the 4 holes provided in the bottom. Easy Peasy.

I would guess that the ones you've seen with no cabinet, were AC-3's. All AC-4's were sold with a cabinet, as far as I understand.
Mind you, I just recently sold an AC-4, that was given to me with no cabinet. But, shortly thereafter, I found a cabinet, which contained a burned out transformer, so I grabbed that up, and sent the cabinet to the buyer, as I have never seen just a cabinet, for sale, at any Hamfest or swap meet, and I knew he was going to need it, for his project.

Dan, they were most certainly available separately. This is where getting ahold of original literature for this gear comes in quite handy- :)

The following price information is from an undated "Condensed catalog" probably from around the mid 70's as it includes the ML-2.

TR-4 transceiver $599.95
MS-4 matching speaker $22.00
RV-4 remote VFO $110.00
AC-4 power supply $99.95
DC-4 power supply $110.00
34PNB noise blanker $100.00

Regards,
Chris

19544. For Sale: Drake TR4C, AC4 and MS4

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-22 19:05:13 UTC
From: Joe W2KJ
Topic: 19544 Message: 19544

Howdy Fellow Drakesters:

I offer for sale a Drake TR4C transceiver, AC4 power supply and MS4 speaker.

The TR4C is a solid 9...the AC4 and MS4 are also in very good condition.

Full RF power output with 3 Sylvania 6JB6 tubes....all tube sockets have been cleaned with DeOxit5 and weak or bad tubes have been replaced.

The receiver sensitivity in this TR4C is excellent.

Package includes an excellent copy of the manual from a commercial vendor.

Will ship the TR4C, AC4 and MS4 CONUS only for $600.

73, Joe W2KJ

Oh you're talking about the steel cover that is sometimes missing from the AC-4. Yes all AC-4 power supplies had that cover originally, AC-3 supplies did not have one, unless they were added late in their production.

I think Paul was referring to the speaker "cabinet" and not that cover.

Hello,

I have a CC-1 Console with the SC-2 (2M Converter) and CPS-1 (Power Supply) modules that i like to sell $275 shipped. May consider trades also.

FWIW
It is an aluminum cover on top of the supply and a steel bottom cover on the chassis
All supplies had a bottom cover, only AC-4 had a top cover
Either supply fits in an MS-4 case

Oh you're talking about the steel cover that is sometimes missing from the AC-4. Yes all AC-4 power supplies had that cover originally, AC-3 supplies did not have one, unless they were added late in their production.

I think Paul was referring to the speaker "cabinet" and not that cover.

Chris,
The cabinets, for the AC-4, were sold separately? I've not heard of such a thing. I know that the MS-4, and AC-4/AC-3, were sold separately. But, I thought that the AC-3's were sold without a top cover, and the AC-4's were. I certainly never heard of either one being sold without a bottom cover. How would it attach to the MS-4 case, then? The one I sold was missing both the top and bottom panels, but, since I found a local fellow here, who had the burned up AC-4, who was willing to give it to me, I removed the two covers and mailed them to my buyer, since I knew he would need at least the bottom cover, to attach it to the MS-4, that was included in the deal.

Dan, they were most certainly available separately. This is where getting ahold of original literature for this gear comes in quite handy- :)

The following price information is from an undated "Condensed catalog" probably from around the mid 70's as it includes the ML-2.

TR-4 transceiver $599.95
MS-4 matching speaker $22.00
RV-4 remote VFO $110.00
AC-4 power supply $99.95
DC-4 power supply $110.00
34PNB noise blanker $100.00

And, with him talking about some having, and some not having, cabinets, I was thinking he was confusing the AC-4, with an AC-3.
Since he mentioned putting it in the MS-4,
(If I get an AC4 now and an MS4 with speaker only LATER can I put the AC4 in the MS4 speaker cabinet myself?)
I presumed this was the question.

Alright folks, I am guessing this is going to be a series of loaded questions, and will arrive at several answers. But, I hope there will be some concensus.

First, though, a little background.

It has become PAINFULLY obvious, to me, that it was ambitious (to say the least) of me to think I could find a way to cram all of my favorite vacuum tube gear, into an 8'x9' room (having room to both operate and repair everything), that I call my shack, here in OK. Also, with acreage, animals and everything else that goes with having a sizable (by city slicker standards) piece of land, I have ZERO time to put, into proper maintenance, of vacuum tube gear, leave alone not having room in the shack, for any operable work bench. So, ALL of my tube gear (with the exception of the Alpha amplifier) is going up for sale, in favor of the most modern of modern radios, a Flex 6500. That should free up enough room for ONE tube type receiver. There is just nothing like the amazing quality of sound from warm, glowing, tubes. I believe that I want a tube type, General Coverage receiver, that will do both broadcast band and amateur bands, well. I own a very nice, recently refurbished and aligned Hammarlund HQ-150. With a big speaker, it sounds awesome. But, I have always been more of a fan of Drake and Collins radios.

So, here's my question. Do I sell the Hammarlund, along with the Johnson Viking Invader 200, that I paired it with? Or not? If I do sell it, bang for the buck, what it the optimal general coverage receiver? Drake? Which? Collins? Which? Is there an advantage of one model, over another similar (R-390, vs. R-390A/SPR-4 vs. SW-4). Something from National? Hallicrafters? Heath?

The only general coverage receivers I've ever owned, have been the two different HQ-150's I've had. It is difficult, to let go of my passion. But, if I want any time, and room, to operate, I must let my tube rigs go to those who will care for them, properly.

If any of you do plan to go to The Hanging Judge Hamfest, you should see me there. I'll be the guy with tables full of Drake and Collins gear. Oh, and a Johnson Invader 200, that may, or may not, have a Hammarlund HQ-150, next to it.

Dan,

I am travelling 150 miles Monday to pick up my dream receiver, the R-390-A (A has mechancial filters). My room is nearly the same size...and I am about to shoot a video of it and post it. I built up from two 8 foot long credenzas on the sides, and a 30 inch deep formica-topped desk across the end. The shelving is built from 12 inch x 46 inch x 1-1/4 thick stair treads. Some shelves are pine, some are old oak stair-treads and some are particle board. Of course I cannot put Johnson Rangers, Viking II's etc on particleboard shelving, just light stuff. One one of the credenza's, where the knee opening is, I hinged a 2 x 3 foot piece of 3/4 ply to the steel credenza, that can be folded down. Under it for support I hinged two decorative stairway banister spindles of good size, which can be folded up underneath the table when it is put down. So far, in a year, I've never put the table down. If I need more room for test equipment I use a fold-away wooden TV table, like one used to use to eat their TV dinners on. When that's not in use it's folded away. So I have all connected and switched and ready to use: 12 pieces of equipment on one wall, including an IFR-1000. End wall desk has seven transmitter/receiver or transceivers along with antenna tuner, AL-811-H amp, 6 telegraph keys and three electronic keyes, plus a patch panel. The other sidewall has two transceivers with power supplies and my computer, plus room for the R-390-A plus 5 or 6 more transceivers or receivers. Then I'll have to call it quits.

I really don't think you'd be sorry going to an R-390 or R-290-A if it has been gone through and is operating as it should. Personally, I'm not really into digital stuff with menus as long as my arm, and still after 4 years, operate the Icom 706 MK-II-G in the most basic manner. I got out of the commercial two way business after I drove 600 miles to a remote repeater site only to find the new super-whiz-bang GE repeater squelch had opened up, holding up the repeater, and it required a lap-top computer to reset it. I resigned as service manager week later.

Good luck...keep us posted as to what you choose and what you think of your choices. It keeps the hobby fresh!!

OT, but I know that some here will find this of value. I've checked the link, it's legit.

==========BEGIN FORWARDED MESSAGE==========

List members:

This was posted this morning on the Collins Collectors Association email list by Bill Carns, President of the CCA. Like BIll, I think this is something that many on the R-390 reflector would be interested in and would lend a vote of support. The USS Slater museum ship, the only remaining WW II Destroyer Escort, is in a competition to receive some grant money. I know that many of you either volunteer or otherwise support museum ships like USS Slater and will see the value in this. Hopefully you can take a minute and follow the link below and add vote for their cause.

The link is towards the end of the post, but I include it here:

http://blog.timesunion.com/giving/final-vote-in-the-capital-region-gives-promotion/2053/

Thanks and 73,

I will risk being slightly marginal about topic here. But not really. This ship is part of our national heritage and also the radio room is stuffed with Collins and deserves to be preserved. All you need to do to show your support of this preservation effort and grant request is to click the link below. I urge you to do just that.Then go visit. I want to thank Tom for his relay here. There was a photo of a great bunch of volunteers working on the ship, but it will not come through the reflector, and may cause a bounce, so I am deleting it.

Bill,

I wanted to as your approval before forwarding this to the CCA reflector. The USS Slater is the only remaining WW-II Destroyer Escort and they are competing for a grant. They need votes. The Radio Room has restored Collins gear and other gear. I found some ham band crystals for their TBL TX in a parts bin. Can you share this with the reflector. voting ends Monday at 5 PM.

http://blog.timesunion.com/giving/final-vote-in-the-capital-region-gives-promotion/2053/

It's the final round of the Capital Region Gives contest. We need everybody's help to share this as far and as wide as you can, and vote for the USS SLATER. We're up against several other worthy not-for-profits. But USS SLATER is special because she was saved by veterans, and restored by veterans, to honor veterans. She stands as a symbol of their courage and the sacrifices that have protected this country and enabled all of the other agencies to do their good work.

These guys put in 17,000 Volunteer hours aboard the ship last year. All we want you to do is click a link.

We need you to vote, and for everybody to share this link. Spread the word for USS SLATER! Let this be our turn. Let's share this and win this.

19555. Re: [DrakeRadio] TR-4C Alignment. Bad 28 28.5 29

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-23 00:42:19 UTC
From: Steve VK2SJA
Topic: 19529 Message: 19555

Got it.

Faulty V1. In fact I seem to have a small collection of poor and not-so-good 6EA8 valves. But by juggling them around (V3 to V1 and the best of a bad lot replacing V3) I can now get the "Injection Crystal Oscillator" alignments all into negative territory. And my negative voltage levels are much greater than with the original V1 tube.

Needless to say the 100KHz Marker Calibrator now sounds like it should. Not distorted.

Couple more questions:-

Currently I have these voltages measurements on the TP

7 = -1.085
21 = -0.806
29 = -0.317

Are these levels OK? Or should they be even more negative?

Next question I think I need to buy a few more 6EA8 valves. Are there any particular brands preferred (or ones that I should stay away from). Good cheaper substitutes?

From: Dieter Horst
Topic: 19557 Message: 19557

Dear all,

I have an ongoing TR7 restoration project (RX is fine now, TX still needs some work) and would like a 500 Hz CW filter to go with it.

For a different project I need the small 7-line accessories cabinet (like MS7, WH7 etc). I know chances are low but if you happen to have one...

I am in Germany but shipping etc. will be fully covered.

73s, Dieter DL5RDO

Topic: 19561 Message: 19561

I was given a "B" line of radios. I'd like to have them refurbished/restored but don't want to ship them. I live in Northwest Arkansas and would drive 6-8 hours to drop off and pick up the set. I've got the R4b, TX4B, power supply/speaker and antenna tuner. I am a fairly new ham and know nothing about tube radios and that's part of the reason I want to drive the radios somewhere. That way, once they're back up to par, I can be shown how to connect them and use them. If you have any information, please reply here or email me at kf5tjc@yahoo.com. Thanks. Jared Drake.

19563. Early T-4 - key connected like old TR-4?

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-23 19:07:26 UTC
From: Steve Wedge
Topic: 19563 Message: 19563

I'm working on a VERY early T-4 (s/n 0017) and have found some weirdness, compared with other Transmitter Twins.

If the CW key is plugged in, I can't get it to pass a voice signal in SSB mode unless the key is also closed. I know this was a "feature" of the TR-3/TR-4's, if you had a key plugged in. Is this just a normal behaviour for the really early transmitters? If it is, I'll leave it alone as this set is all-original and in excellent (9/10) condition.

19564. TR4CwRIT CW Switchover time

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-23 19:10:28 UTC
From: <mkellync@...>
Topic: 19564 Message: 19564

Hello everyone,

In reading the manual for a TR4C it says if the time it takes to cycle from transmit to receive is too long, change it by decreasing the Vox Gain. Nothing happens for me, so, if doing so makes little or no change in the time delay, what is likely the problem?

Mine is a CW/RIT version, but I am assuming that will make no difference. I have had a number of TR4 transceivers and do not remember having much success in changing the delay much at all - or at least nothing like what you have with a T-4X transmitter. Am I missing something?

Thanks,
Michael nz4d, ex/kb4mk

Guess I just never noticed this before! I see in my version of the manual that it says the key needs to be removed or left in key-down for other modes.

I do believe they may have changed this with later units, as I was using a late T-4X last weekend, with a key plugged in and not keyed, on SSB.

I got a T-4 s/n 0018 in 1965 and that is the way it is. I had it converted to a T-4X later, but the serial number was not changed. My TR-4 C works the same way. The key must be unplugged or the contact shorted.

Steve -

A set of contacts was added to the FUNCTION switch during the T-4X, fairly early, that shorted
the KEY bus in SSB. I think it always worked in TUNE or CAL, but not in SSB.

Michael -

There is a resistor, R106, that sets the delay time. It is originally a 3.3M, but some drift up
in value, lengthening the delay time.. You can choose a resistor to get it in the general range
you like, then 'fine' adjust with the VOX GAIN control.

It's on a board between V19 and the AF OUTPUT Transformer, right on the top edge of the board.

It requires closure of the key for tune or ssb. Interestingly, the old manual I have (which did not come with the T-4) mentions that the key must be closed for other modes if there's a key plugged in.

First whether you decide to work on this stuff
yourself or not I strongly recommend that you get Garey
Barrell's service discs. These have high resolution
instruction books and other stuff not available elsewhere
including very good hi rez photos of the chassis. The B
line disc also covers the Drake antenna tuners and linear
amplifier.
Drake stuff is not hard to align or work on. Unless
your rig has a particular problem the main thing is to
rebuild the AC-4 power supply. Kits of parts are available
from a couple of places. This is a simple job requiring
mainly soldering and using a screwdriver. Alignment needs
mainly a decent electronic voltmeter. A signal generator is
helpful but the internal calibrator will serve for most of
it. The procedure is not difficult. The main difference
between vacuum tube and solid state equipment is the
presence of high voltages in the tube equipment. Those of
us who grew up with it learned some simple safety
precautions early but the main thing is to be aware its
there. I can understand wanting to start off with every
thing right but its also good to have some familiarity with
the gear. The stuff in the discs will help and you should
have it even if you never intend to take the covers off.
I run the B line with an MFJ antenna tuner. The latter
has a power meter and VSWR meter in it which I find helpful.
The combination is excellent. The B line has all the
features that are really useful and is hard to improve on.
Once you have it up and running you may want to invest in

extra crystals to expand the range. The B line will over
the entire 10 meter band and the WARC bands. I use the pair
as a transceiver for the extra frequencies with the receiver
as the frequency control. But the transmitter will also take
extra crystals, just not as many.

19577. R-4A Hum

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-24 03:19:51 UTC
From: <k6ctw@...>
Topic: 19577 Message: 19577

Sent this to Gary as well but thought I'd also put it out to the group.

This is on the R-4A (2xxx series, 13-tube) I got on eBay a couple weeks ago.

On my communications speaker I hear no hum at all. Probably because the speaker can't really "hear" the 60 cycle frequency. Same is true of the old phones I have that I use with a 2-B. However, when I use my really super phones (from Arlen Communications) I hear lots of hum. By the way it's the Same on the Drake 2-B in that I only hear hum on the super phones.

Note that on the R-4A I did replace R43, R44 with 1% 1 W and C131 with a 10 uF/250V electrolytic. It did improve things but the hum is still there. Also put in a new 6EH5 as it was microphonic and as per Gary's troubleshooting guide on the CD he sells, V6 the 6GX6. I have not had a chance to check the other tubes yet, but wonder if that is a possibility as well?

On a side note, my R-4C does not have a trace of hum on the Arlen Communications phones.Ideas anyone?

Thanks Garey, unfortunately, I did not do a good job of clarifying .... as I am trying to lengthen or increase the change over time between transmit and receive as it is really fast ... if you are not running 28 wpm+ it is a bit fast and drops out in between words. So the resistor the likely culprit you reckon? Thanks as always for the help.

Ken -

I think you may be seeing 'low gain' hum. Where does the GAIN control set on the 'old' and 'new' phones?

The situation is that the AF stages run 'wide open', and the volume is controlled by the amount
of signal applied to the input. So if the signal / noise ratio is 10:1 at normal volume, (GAIN
set to about 10-11 o'clock,) and your 'sensitive' phones make you turn the GAIN down to 7-8 o'clock, the signal drops to 5 but the noise is still 1, the s/n ratio is poorer. More hum &
noise. This is improved by putting a resistor in series with the phones to allow you to increase the AF GAIN control to improve the s/n ratio, without bursting your eardrums.

If the AF GAIN is running at 10-11 o'clock with your sensitive phones, then the problem is in
the receiver. You can change the coupling capacitor, (make it smaller) to reduce the response
to low frequency hum.

Beyond that, you're talking more serious changes to the receiver such as rotating the Power and
AF Output transformers to decrease coupling, etc. Another list member did some serious changes
to a couple of receivers by re-orienting transformers, shifting lead dress, etc.

Another alternative is an audio output filter to roll off the low end, -OR- don't use the 'sensitive' phones!!

Does the hum go up and down with the AF volume control? Can you get an actual AC volt reading at the headphone or speaker jack? If so, I'll do the same with my R4A, which has a slight hum and all new caps.

Gary,

Thanks for the excellent advice. With the sensitive phones, I hear the hum with the gain from 7 - 9 o'clock, and then after that it's mostly gone. With the older phones and the speaker, I need to get the gain to about 10 o'clock to get listen-able volume. So, sounds like I'll be putting that resistor in series with the phones then. I'll give that a try when I get back from work this evening.

In situations where I did not want to overhaul the audio chain on receivers that use a common AF amp for both the speaker and headphones, I've made the following modification with good results.

As Garey discussed, you can insert resistance with the headphone lead. In doing so, the effective signal-to-hum ratio improves, provided the peak audio level stays comfortably below the audio clip point. Since I detest using mono-to-stereo adapters (for use with modern phones), one can install a Switchcraft Tip/Ring/Sleeve (TRS) 1/4-inch jack in the Drake receiver and accomplish two goals at the same time: (1) hum reduction; and (2) mono-to-stereo conversion.

Audio from the amp transformer is routed to both the tip and ring contacts so that stereo phones can be used without an adapter. Switchcraft makes several versions of their high-quality sealed 1/4-inch jacks. The type to get has an extra "normalled" contact closure. Cosmetically, the new 1/4-inch jack looks exactly the same as the old one. It works like this: When the speaker is used, the normalled contact shorts out the series resistor. When headphones are plugged in, the mechanical operation of the plug insertion lifts the normalled contact and you now have the benefit of hum reduction through the resistor. With the shorting of the resistor, full audio power delivered to the speaker is restored.

Woody -

There is a 'title block' in the lower left corner of the photos that appears when you 'hover'
your mouse in that area. When you click on a picture in an Album, the block is shown also. Most
of the pics in our group are mentioned in a post, and then referenced from there.

My TR4CW has a "Relay Delay Mod". The circuit diagram was provided by Bill Frost to the Drake list and designed by Thom LaCosta. It consists of a 15 meg pot and a cap added to one end of R106. I can provide the circuit diagram if you want.

OK. That resistor is selected for the desired delay. You don't say if this is a 'change' for
you or is this a 'new' radio to you?

Too short a delay could be caused by someone changing R106 to a lower value, or leakage in diode
D5, or, least likely leakage in C143. Bad solder on either lead of C143 is a possibility. Also
check the mounting 'foot' of Board 4 to the chassis (tighten mounting screw if loose, or loosen
and retighten.)

Yes, that mod was circulated,it was originally distributed by Drake for the T-4X which did not
have a rear panel adjustment at first. Nothing is ever NEW! :-).

Essentially you're putting the 15M pot in place of R106. I don't recall an extra cap, but perhaps the long leads were bypassed. Plus you have to drill a hole in the rear panel. Generally, you can select R106 to give you sufficient adjustment with the VOX GAIN control.

But too short at 28 WPM means that either R106 has been changed or there is a fault in one of
the components I listed.

Hello,

I just found a box of tubes that I had left behind at my dads place while I was in the process of moving and it contains a lot of brand new 6JB6A National Electronics tubes. They are in the red and white boxes. I know most of what national electronics sold was re-branded regular type tubes and your results may vary in a big way. I think on average they aren't too well thought of. So far in inspecting a few of these tubes I have found the short variety and also the taller tubes. Does anyone have experience with these as far as finding out whether or not they are decent tubes? I haven't looked to see if the internal structures match up to being sylvania's, rca's, philip's, or whomever. My guess is that they were produced in the 80's and are likely the last batches of what somebody made and called 6JB6's. Anyone know if they are the last of the sylvania's or philip's? Thanks for any feedback you guys have on these.

I've never had very good luck with National tubes, but then I've avoided them! :-)

You can check the general quality with the 'matching' procedure I described a couple of days
ago. If they draw ~35 mA at between -55 to -60 VDC of BIAS. If that's ok, about all you can do
is pick two that 'look alike' internally and take the 'same' BIAS voltage, and install them in a
transmitter. See if you can neutralize them, (check on 20, 15 and 10M,) and then see how much
power they put out, especially on 10M.

If that all works out, then use them! Perhaps someone knows who made them, but by then they were building one tube design and marking it under several different types. They probably checked them at 16 kHz, but not at 30 MHz....

Fellow Drake Enthusiasts,

Captions would add more detail to the pictures but there is the issue of the time it takes to edit, insert, etc. the information. Since the website is a labor of love, we should all respect the wishes of the host and the time and energy available versus other life obligations. It is a thankless job (but we can all take a minute to thank the host can't we?!) and I for one greatly appreciate what has been available to me for "free".

Let's all enjoy those Drakes.

73,

Evan, K9SQG

Steve -

Early TR-4 filters were 2k in and out, same as the TR-3. When they went to the two filter scheme, the filters were 500 ohms in and out. The schematic shows 470 ohm, 5% resistors across
the in and out filter matching transformers.

The C-Line and 7 Line filters are all 50 ohm in and out.

19594. Re: [DrakeRadio] national electronics 6JB6 Tubes

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-24 19:59:53 UTC
From: Robert Logan
Topic: 19589 Message: 19594

In my experience, red and white boxes contained RCA tubes. Not saying all tubes in red and white boxes were RCAs but all RCAs were in red and white boxes, at least those I handled, which were considerable. Bob, NZ5A

On Mar 24, 2014, at 10:30 AM, el34guy@... wrote:

Hello,

I just found a box of tubes that I had left behind at my dads place while I was in the process of moving and it contains a lot of brand new 6JB6A National Electronics tubes. They are in the red and white boxes. I know most of what national electronics sold was re-branded regular type tubes and your results may vary in a big way. I think on average they aren't too well thought of. So far in inspecting a few of these tubes I have found the short variety and also the taller tubes. Does anyone have experience with these as far as finding out whether or not they are decent tubes? I haven't looked to see if the internal structures match up to being sylvania's, rca's, philip's, or whomever. My guess is that they were produced in the 80's and are likely the last batches of what somebody made and called 6JB6's. Anyone know if they are the last of the sylvania's or philip's? Thanks for any feedback you guys have on these.

19595. Last Call - Voting closing on the Slater Grant

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-24 21:09:27 UTC
From: Garey Barrell
Topic: 19595 Message: 19595

OK guys, the voting closes in about an hour and the Slater is only ahead by 50 out of 30,000 votes...Like a tie.

If you have not voted, please do it now. This will help preserve a WW II ship and preserve a radio room full of Collins.

So - Once again, I will publish this link that will let you vote for the grant to support the USS Slater (Collins Equipped) radio room and ship restoration.

The grant will be given after the vote is closed in about one hour - so time is short.

This is a worthy cause to preserve history and honor our vets. The CCA supports this and hopes you will take the time to vote. It just takes a moment - literally. Just go to the link page and scroll down to the vote and click the Slater box and hit "VOTE".. She needs your support. It is a very close vote for this grant. If you have more than one computer, you can vote from each of them. The competition is doing it.

Tell your military oriented friends and pass this on to other "populations"

if you get a creative thought.

Go To:

http://blog.timesunion.com/giving/final-vote-in-the-capital-region-gives-promotion/2053/

scroll down to the vote, click on the Slater line and hit vote.

If the URL wraps funny, repair it and fire away.

Those are a 4-24 x 1/4" "thread forming" screw. I think this is the same screw used on the radio faceplate corners, around the meters on the L-4B, and a few other places.

I have a box of stainless steel ones at home, drop me a line if you don't want to order 100 from somewhere.

Regards,
Chris kc9ieq

Yeah, plain 'ol #4 sheet metal screws will work too, if you don't mind the piercing tip instead of being blunt like the originals. Also the pitch may be slightly different, but that shouldn't really matter so long as the holes aren't stripped out.

19600. FS: Drake SW-4A

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-24 22:49:16 UTC
From: <cdorn@...>
Topic: 19600 Message: 19600

Hi all,
I'm on the move, and am selling my Drake SW-4A, serial 2590. Radio is in very good to excellent condition,
and has had the electrolytic caps replaced. Some surface scratches on the cabinet, but the chassis is corrosion free. Comes with complete set of NOS tubes, and manual copy. Present tubes are strong, and it plays very well. Asking $300 plus freight from Western Canada. Please contact direct if interested. Photos available.

73,
Chris VE6IY

19601. FS-4 injection level?

From: <w6mqi@...>
Topic: 19601 Message: 19601

I've been playing around with my Eico Rf signal generator injecting crystal freq's into an open crystal slot on the R4B which seems to work rather well I call it the Macgyver FS-4. What would be a standard injection level for optimum performance going into the R4B? I was using 73mv which was working okay. Also been looking at this http://www.qsl.net/k5bcq/Kits/Kits.html http://www.qsl.net/k5bcq/Kits/Kits.html Si570 it has a square wave output so I'll need some way of changing to a sine wave i.e. low pass filter. I have also used the elecraft XG-3 which also has a funky looking square wave output, but it does work. I assume a sine wave would be the best option here?

All,
Well, adding in a small resistor did help quite a bit. I ended up using an 8.2 ohm one that I had. Tried a 330, 100 and 51 ohm but they degraded the speaker output too much. The 8.2 ohm moved the hum down to a tolerable level and had only a little effect on the external speaker. Thanks Gary and all for the ideas etc.

I don't have the specs on them, not sure if they're the same as the ones in the L7 amplifier or not. Please remember that brighter, more current, etc. are not necessarily better. Heat and aging make that white plastic housing brittle and when it starts to crumble, it is difficult to repair; finding a replacement is very difficult. Hence, if one is going to err, going on the "less heat" side is preferred.

Dave,

You may also have a look at the N3ZI DDS. I'm using it with my C-line, connected to the inj jack. I set the crystal switch to an open socket and the T-4XC set to receiver control. The DDS is set to take care of the IF and Receive frequency; no crystals needed or VFO for that matter. I had to build a small amp as the output is only 250 mV P-P. It has a very clean sine wave. The backlit display is quite nice compared to the standard black / green LCD.

Those would probably be good candidates for LED replacement, for those reasons. They are run
from the 13.6 VDC Primary power, so a small, white LED with a current limiting resistor in some
shrink tubing, using the red wire that is there would be an easy fix. Just gotta get the polarity right!

Doug,
I have looked at the N3ZI kits before and they look very interesting. My idea was to retain the original VFO's on the Drakes so I was planning on injecting through a spare crystal socket like the FS-4 did. Not really looking for a DDS VFO with LCD display, just looking to be able to do GC with the Drakes while keeping the original workings of the rigs. I envision a FS-4 look a like box maybe Arduino based or what ever with three rotary encoders to dial up frequency's like the FS-4. Anyway just in the dreaming stage right now nothing set in stone.

Thanks Dave.

19614. Testing a "new" AC4

Dave,

I have retained both the VFO on the Receiver and the transmitter; after finalizing the layout in an external box, it will be installed in a separate enclosure. Right now, all of the parts and pieces are on my bench for testing purposes. At any point that I want to tune with the Drake VFO, I can just uncouple the N3ZI DDS and turn the crystal switch to the correct crystal and tune as normal. My first goal was to make no modifications to the rig, otherwise I wouldn't have entertained the idea. The second goal was to have a general coverage receiver without the need to buy crystals at $15 per. The third goal was to be able to hit the memory button and go exactly to a frequency without the guesswork of the VFO dial and then tuning to other's voices. The other nice addition is having a RIT function. Probably the biggest enticement for me however; was some experimentation and learning along the way.

The N3ZI could be used exactly as you described, take the output and inject it into a crystal socket, set the frequency to the required crystal frequency and then tune with the VFO. Same as the one you were using. I don't know anything about the kit that you are looking at, but thought I'd mention the N3Zi as I had used this one. It is very cost efficient and will do <1 MHz up to 34MHz filtered. It also has an RS-232 interface for configuration changes etc. It also has an unfiltered output if you need to do different filtering.

73,

Doug – N9XTF

Subject: RE: [DrakeRadio] FS-4 injection level?

Doug,

I have looked at the N3ZI kits before and they look very interesting. My idea was to retain the original VFO's on the Drakes so I was planning on injecting through a spare crystal socket like the FS-4 did. Not really looking for a DDS VFO with LCD display, just looking to be able to do GC with the Drakes while keeping the original workings of the rigs. I envision a FS-4 look a like box maybe Arduino based or what ever with three rotary encoders to dial up frequency's like the FS-4. Anyway just in the dreaming stage right now nothing set in stone.

Thanks Dave.

Paul,

Garey or one of the guys will chime in shortly with better info, but in the meantime here is my two cents.

Like chasing a wabbit, be wery wery wery careful; as you know, the power supply contains very high voltages. I'm sure you know this but the disclaimer has to be there.

I never connect an unknown power supply to one of the drakes. I short the molex plug and measure all of the unloaded voltages at the plug. I run the bias pot up and down to ensure that I have the correct range of Bias. The second thing I do, is install either one of the Sunlight energy systems or K0UYA power supply rebuilds. If the power supply tests ok, odds are it might be ok for service, but I take my Drakes very seriously and I would really be mad at myself If I burnt one down because the bias failed etc etc. A $75 rebuild is easy to justify for me on a rig that I plan on keeping.

Hope you get the answers that you are looking for.

Hi Paul,
Other than just replacing all the caps, you could use an ESR tester to check the electrolytics. I've seen lots of Drake supplies that are OK in that respect, and usable. The bias caps are usually the first to go, and they should be replaced just for safety anyhow, since they can cause you a lot of grief, e.g. melted down final tubes with out warning.
Doing the full rebuild is something that you'll never regret doing, tho'.

You can run the AC-4 without connecting it to anything.
Short pins 1 and 4 on the plug using a short bit of wire to
make the jumper. Strip about 1/4 inch off each end and push
into the plug. Now when the supply is plugged into the line
you can measure the open circuit voltages at the connector.
Use some caution because the plate voltage is quite high, on
the order of 700 volts, and can do you in.
You can fire it up first using a light bulb in series
with one side of the line to check for an immediate short.
The ideal way to do this is to use a metered Variac but not
many hams have them.
You can do some checking before powering up the supply.
Check the diodes for shorts or opens, this can be done with
a VOM. You can check to see that none of the electrolytic
caps are shorted but a VOM will not tell you if they have
high leakage unless its close to being a short. Note that
what you want to check is _parallel_ resistance or leakage,
not series resistance. High ESR in a filter cap will cause
high ripple but not short the supply. When the supply has
been running for a few minutes check the voltages. Note
that you may get somewhat higher voltages than are shown on
the AC-4 schematic due to the lack of a load.
Especially make sure the bias supply is working and
that the adjustment works.
There are many warnings about replacing electrolytic
caps but in my experience they are rather more reliable than
is the popular wisdom. The one thing that electrolytic caps
do not like is being left without voltage for very long
periods of time (years) because they depend on the voltage
to maintain the capacitance mechanism. If left without
voltage they will slowly stop being capacitors. Even though

there is a military manual on re-forming electrolytic caps I
don't trust this procedure at all. New caps for the AC-4 are
available from several sources. If you don't know the
history of the supply its best to invest in one of the kits
and replace all the parts that go bad with time. The kits
are not expensive and are not difficult to install.
Having said all that I think if your supply survives
being fired up and run for an hour on its own its probably
safe to use it as is.

It's pins 1-2.

You can get by with a good working powersupply and may outlast you or it may go tomorrow. $75 just seems to be a good investment or insurance to protect a rig that you plan to keep.

It's personal preference. You will hear pros and cons both ways.

Paul, I bring unknown AC-3's and AC-4's up slowly with a Variac and monitor the input current. By "slowly", I'm talking over a period of 10 - 15 minutes. If it's going to smoke, it's best to get it over with and rebuild!

The voltage busses vary from their nominal values by a fair amount and nowadays are typically on the high side, since most US AC mains are at or above 120 VAC. As long as you have "approximately" 750, 250 and -65 VDC, you're good. Filaments should be around 12.6 VAC but can be over 13 with higher mains.

I'd use it to play for a while, but I'd get a rebuild kit ASAP and just get the job done to stop worrying. Until you rebuild it, always monitor your PLATE meter and NEVER leave the set unattended!

Paul -

Absent an ESR meter, the dim-bulb is the best start up. Do not do the ''internet expert' bring
the voltage up 10 volts per hour' garbage!

Absolutely first thing is to check the fuse! It should be either a 5A or a 6.25A 'Slo Blo' fuse. Next I would run an ohmmeter check on each of the electrolytic caps to spot any dead ones.

The supply will run 'unassisted' by shorting Pins 1 and 2 together. You should see approximately the following voltages with 120 VAC input.

+700 VDC

+270 - 280 VDC

-50 to - 90 VDC

12.6 VAC.

If you've already inspected the T-4XC, plug and play with the dim-bulb tester. If ok, short out
the bulb and play!

One last thing I should have added. Do NOT leave the supply/transmitter unattended, even in STANDBY. A BIAS supply failure WILL kill the transmitter, possibly along with the power supply,
not to mention a fire hazard.

While I still have supplies with the original electrolytics and low ESR, the safest approach is
to install one of the upgrade kits from either Jeff or Mike. Either kit replaces all the pertinent parts in the supply, with the primary differences the mechanical arrangement of those
parts. Either will also probably last another 30 years!

Yep, Pins 1 and 2. I would strongly suggest replacing at least the BIAS diode and electrolytics. If one of the other supplies quits, the radio just quits. If the BIAS supply quits, VERY bad things happen, starting with destruction of expensive PA tubes, likely before
you can hit the kill switch! :-)

Dave,

Garey had told me that I needed 2Vrms to supply sufficient drive. He also let me know I needed to find out what the impedance of the Inj jack was however; I have been unable to discover this information. ON 80M – 14M my buffered amp DDS combination will supply 1.9Vrms at 50 ohms, at 15 and 10M the output drops to 1.3Vrms and 1Vrms respectively. The sensitivity is identical to the receiver without the DDS and buffered amp connected for the exception of 10M. 10M works well but suffers a little bit, I see a drop of about 1 S unit using the DDS / amp combination. I am still experimenting with the buffered amp to try and get a little more out of it on the higher frequencies without distorting the signal.

Lee,

Right now, I am using the Kits and Parts design. Every design that I have come across offers about 20db gain.

I am using the raw output of the N3ZI DDS and filtering at the output of the buffered amp. Its output is in the order of 250mV P-P. I calculated a 3db frequency of 40MHz and am using a 5 pole filter. I may have to increase the range of the filter to get the output up at the higher frequencies. Remember that I am injecting the operating frequency plus the IF frequency so I'm in the 33MHz range for 10M.

Have you had any more success with your setup and if so what voltages and setup are you getting?

Is your filter LP...what's the cutoff? What is your insertion loss?

Have you had any more success with your setup and if so what voltages and
> setup are you getting?
>

I'm going to inject lower band frequency plus 11.1 MHz, or for 10MHz, my oscillator is running at 21.1 MHz.

I'm using an AD9850 module off eBay, which (memory at work here) I think is about 250 mV or so. I'm using a home-made version of the same buffer you are and am getting about 7 V P-P driving 50 ohms...I actually need to turn mine down! That's at an oscillator frequency of 21.1 MHz. I'm running my buffer off 12 V FWIW...and the 2N5109 is running pretty warm without a heatsink.

My next step is to measure the output across the 11.6 through 40.6 MHz spectrum (not sure I'll get output that high with the AD9850) and see where it falls off and how much. From there, I'll play with the bias in the Diz buffer and shoot for 2 to 2.5 volts.

I'm not filtering my output...I'm only using in on receive, and the R-4's tuned circuits should take care of hearing anything from the harmonics I would think...the 9850 puts out a sine wave.

I don't know if the R-4 will be even slightly usable at 500 to 1500 KHz, but since it's only a quick programming change, I figured why not try it!

Lee -

The 9851 DDS from eBay will cover the frequencies needed. Just a few dollars more.

Yes, 7 V p-p is a bit much! 2-3 V p-p is about right, 100 - 200 ohm input Z.

The R-4(any) will 'work' below 1500 kHz, but the it's outside the range of the Preselector, which ends at 1500. Most BC stations are strong enough that it won't matter, but you won't be
doing any 'DX'ing' the BC band with it!!

True, but I've got a handful of the 9850s and one is already soldered
in...that, plus I'm not terribly interested in using the R-4 on 10m, so, at
least for the first one, I'll just go with the cheapo.

> Yes, 7 V p-p is a bit much! 2-3 V p-p is about right, 100 - 200 ohm input

OK, I'll look at around 150 ohms then.

That's really what I expected...figured I'd just use it for WSB and
such...If I was really serious about BCB, I'd probably build a
converter....hmmmm.

I have a limited amount of time after work with my new job. I have 4 repeaters to maintain and would like to have someone look at a issue with my UV 3 radio. The radio has all 3 bands installed. Lost 2 meter receive last summer. Transmits good on 2 meters . All other bands are working but could use a alignment also. thanks

Garey,

I cut a snipped from a previous thread; it’s of no consequence but this is why I was chasing 2Vrms, LOL! If 2 Vpp will take care of it then I wonder why my sensitivity is low on 10M. The output waveform is clean and undistorted, I wonder if the impedance mismatch may be to blame here?

Thanks so much for your help!

Doug – N9XTF

Quoting Garey Barrell

Doug -

I haven't tried it, but the first step would be to determine the input impedance of the INJ jacks on the R-4C and T-4XC.
Then a simple transformer will probably suffice. You need about 1.5 - 2 VRMS at the PreMixer frequency (7.3 - 35.6 MHz)
into either INJ input.

You might take a look at the PHSNA project Yahoo group for ideas. We used either a 2N5109 buffer or an MCI ERA-3+ MMIC
to get about +10 dBm into 50 ohms (0.7 VRMS) from a 9850/51. You need about +20 dBm _into 50 ohms_. I suspect the
input impedance is considerably higher, allowing use of a simple transformer to get the higher voltage.

Really not nearly as simple a project as it looks, to do it right. Do you REALLY need to know your frequency to better
than +/- 100 kHz?

Doug -

One of us has made a mistake! The INJ signal level is 2-3 V peak-to-peak, not RMS. The impedance is 100-200 ohms.

OK! You win! :-)

Shoulda been p-p...

You could try a 50 ohm termination and a coupling capacitor. A ferrite bifilar matching transformer would be more efficient.

19644. DDS VFO to 2NT

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-26 19:27:14 UTC
From: <s.whitehouse42@...>
Topic: 19644 Message: 19644

I am in the process of putting together a DDS VFO to use with my Drake 2NT xmtr. One feature of the vfo is to shift the frequency away from the receiver band pass by switching a pin on the processor to ground during receive. My first thought was to use the vfo key jack on the 2NT but it has -100V DC on it during key up. I need a switch to go to ground during key up. Has anyone on the list done this already or have ideas on how I should proceed? Would it be possible use this -100 volts to key a transistor switch to control a relay without affecting the operation of V1A XTAL OSC?
Thanks for any help,
Stew ke4yh

Hello Stew,
from the schematic diagram, the VFO KEY is connected to the cathode
of the oscillator and it is switched to ground during TX.
During RX, it seems that you will have +80V, not -100V, have you
measured that voltage?
If the voltage is +80V, you can use the VFO KEY to drive a low voltage
digital input with pull-up resistor, if you add a 1N400x diode in
series, with cathode to VFO KEY and anode to your digital input, to
block the +80V.

Hi Guido,
Thanks for your response. I measure -100V (99.6) at the VFO key jack during receive. Of course it goes to 0 when xmtr is keyed. By connecting the diode's anode to the VFO KEY it blocks the -100V and the resistance drops to about 22 Ohms, across the diode, with key down. I need to think about how this helps me. Maybe this 22 Ohms can act as a pull-down on the processors analog input pin.
FYI, the DDSVFO is from the AD7C Blog site.

Thanks Greg,
I think I have one of those around that I used with a 30L1. Should it be interfaced with the VFO KEY jack?

You might want to check out this month's Electric Radio magazine as i have just such a circuit in there. It will work with either the WA1FFL (my personal favorite) or the N3ZI VFOs. The WA1FFL offers a nice driver circuit/kit to get the output up to the 8+ volts swing you'll need and he has a bandswitch option that is designed for rigs like the 2-NT, DX-60 etc. I also have an article in the January CQ which shows a bit more and has some pictures of my engineering prototype. Since that article I've made a couple more changes which provide better timing and a 60 Hz notch filter. I've also laid out a PCB that I'm checking out now. maybe I'll make that available too.

Good luck and let the list know how it goes.

19651. Drake 2A/B Crystal Calibrator

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-27 01:33:52 UTC
From: L L bahr
Topic: 19529 Message: 19651

I am about to receive a Drake 2A receiver with no crystal calibrator. I want one in the radio so I plan to build one up pretty much as original Drake. (I don't know where I can buy one and they are overpriced anyway when they show up.) To make a calibrator, I plan to make the box out of PC board material. I have the tube, tube socket, crystal, crystal socket and the ceramic trimmer condenser. That leaves the 4 pin plug. Does anyone know a source for this plug? If not, my plan is to use some number 12 wire if that size is correct and use short pieces as pins mounted on pc board material. Better yet would be if I could find some real pins to use when making up the plug. Anyone know a source for the right size plug pins? (I know you can buy 7 pin plugs for a TR-4 but not 4 pin plugs. I am not sure if the pins would be the same size. If so, I could maybe rob pins out of a 7 pin socket and use them in a home brew plug using PC board material.) Any thoughts? (I do not want to use a solid state crystal calibrator.)

I just found out the 7 pin NB plug pins are much smaller in diameter then the 4 pin crystal calibrator pins.
Lee, w0vt

I am about to receive a Drake 2A receiver with no crystal calibrator. I want one in the radio so I plan to build one up pretty much as original Drake. (I don't know where I can buy one and they are overpriced anyway when they show up.) To make a calibrator, I plan to make the box out of PC board material. I have the tube, tube socket, crystal, crystal socket and the ceramic trimmer condenser. That leaves the 4 pin plug. Does anyone know a source for this plug? If not, my plan is to use some number 12 wire if that size is correct and use short pieces as pins mounted on pc board material. Better yet would be if I could find some real pins to use when making up the plug. Anyone know a source for the right size plug pins? (I know you can buy 7 pin plugs for a TR-4 but not 4 pin plugs. I just made several plugs to use between the AC4 and the L4B using 3/32” brass tubing for the pins obtained from Hobby Lobby. I used plastic I machined using a router and drill press to fashion the holders. They work great. Perhaps you can do much the same thing for the 4 pin plug you are looking for.

Donnie at '2bradioparts' made a few calibrators using that method. I think he quit making them,
but they were nice and fit quite well. The copper PC board made for an 'almost original' look.

Steve had it right, the pins are 0.094" or 3/32". Most hobby outlets have brass tubing in that
size for a few bucks. Or if you have some dead octal tubes the pins can be pulled out of the
base without damage, with a little care.

Just print the socket layout on the bottom PC board and solder the pins right to it.

OK, Garey, yep that is what I will have to do. I will stuff the pins into PC board lands etched on the bottom PC board cabinet piece. I did have numerous conversations with Donnie today. I appreciate knowing the pins need to be 3/32 inch. I'll go pick some Hobby Lobby brass up tomorrow.

Here is a bomb shell. I ordered a couple Drake cans from Hayseed Hamfest today and Tom wrote me he had a bomb dropped on him yesterday. One of his suppliers ceased making parts for them. Consequently no more cans for a TR-4C or 2A until he finds another supplier. My cans for these rigs are now back ordered. He hopes to find another supplier soon, but at the moment cannot predict when he can supply cans again.

Cool... See if Donnie has dimensions for that layout. I get 0.312" wide pins, 0.250" narrow pins, and 0.200 between pairs. But the ol eyes and hand tremors make it difficult! :-) If I didn't know better, I'd say 0.30, 0.25 and 0.20!

Not good news from Tom! He's overcome supplier problems in the past, and I'm sure he'll pull it
out again..... Joys of manufacturing!

Garey,

T hanks for the dimensions. I don't have the 2A in my possession so I can't measure anything. As soon as it arrives I'll do some close measuring. and in the meantime I can get other things rolling for the project. You are right, real calibrators are priced through the roof. They are going for a little less then what I paid for the radio!

I happen to have a 5-pin plug that will work for the calibrator plug. All you need to do is remove the 5th pin which is centered between the other 4 pins. It is a perfect match to the socket and can be soldered just like you would an octagonal plug where you run the wire into the pins and solder it there.

19663. Error in AUX7 Manual - RRM7 and RTM7 Module Programming

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-27 21:00:52 UTC
From: Don Buska - The Radio Lab Works
Topic: 19663 Message: 19663

While recently building some diode AUX7 modules for an R7 user an error was discovered in the original Drake manual "AUX7 AUXILIARY PROGRAM BOARD, MODEL 1536". There are different version of this manual. My personal physical copy was an earlier version that did not show the R7 VLF modules. FYI, the programming for the AUX7 modules for the 0.0-1.5MHz ranges (three modules) are different between the TR7 and R7. In later manuals the three R7 VLF range programming lines were added to the bottom of the original table.

It was found that the R7 module for the 0.5-1.0MHz range was not correct. After consulting the schematics it was discovered that the range pins (2-9) should be the same between the TR7 and R7. Only the band selection pins (10-14) are different. This is because there are additional band filters installed in the R7 for these VLF bands. The TR7 VLF has no band filtering. i.e. it is a direct connection to the first mixer!

/The error is for pin 3./ In the manual pin 3 for the R7 module shows that this pin is not cut (no letter C). *However, to match the TR7 range setting this pin should be cut! * For those building their own AUX7 modules for the R7 please note that means no diode would be installed for pin 3. If you don't make this correction the R7 0.5-1.0MHz AUX7 range will not work and would display 99 at the beginning and not properly provide the correct synthesizer divider setting.

My guess is this R7 AUX7 module programming error had not been discovered in the past 30 years due to very few people programming their AUX7 board for the VLF frequencies on a R7. The R7 has these VLF frequencies directly selectable as standard bands on the main band selection knob, vs the TR7 which can not receive the VLF range without the AUX7 and the programmed modules.

BTW, here is the link <http://www.qsl.net/ea4bb/EA4BB/Old_Radios_files/AUX7.pdf> for the manual that contains the error.

Don,

I noticed this when I was reverse engineering the code for the PROM on the DR-7. Thanks for the confirmation. Muck like you, I pretty much assumed that it was silly for anyone to waste R-7 AUX-7 slots on VLF when it was available on the band switch and I didn't give it another thought. The only reason I can think of for it would be an R-7 without a DR-7. I suppose it's possible that the Easter Bunny or the Tooth Fairy might have one like that....

Hi Group,

I found about 20 plugs and 30 sockets. They're the 5 pin version just remove the middle pin. Your are right Garey they where used mainly in battery valve radios and valve weather balloons in the 60's and 70's. One can still find them here at HAM fest's. I am only to happy to send one (for free) if it's a genuine need for a project.

They were also common on aftermarket car stereo equipment in the US before the proliferation of BTL outputs. Radio Shack used to carry the wire harness with the plug on the end if you needed to move your 8-track player to another vehicle and needed a new cable...

Hi Stew,
I've just checked on my "brand new" 2-NT (bought one month ago and,
shame on me, still not tested...) and I've measured PLUS 90V on VFO KEY.
If you have not inverted the multimeter probes or misread the measure
;-) your 2-NT has been modified (maybe, bringing the KEY input to the
VFO KEY as well) and should be restored to the original configuration.
With +90V, it is very easy to use the VFO KEY to control the MCU of your
DDS, using a diode with cathode connected to VFO KEY and anode connected
to digital pull-upped input of DDS.

Thank you Guido,
My 2NT is new to me also. I haven't had the covers off yet. It definitely has -100 V on the center pin of the VFO KEY Jack. manually shorting the jack turns the oscillator on but doesn't key the transmitter. The KEY jack on the front panel has -118V on it. I use a Navy Flame Proof key with it and the contacts are covered.
I had the transmitter on the air and it appears to work normally at 50 Watts out. Made several contacts including a VK4! on twenty meters.
I guess my next step is to pull the covers off and start the refurbishing project.

19671. Re: DDS VFO to 2NT

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-28 21:08:02 UTC
From: <w5rkl@...>
Topic: 19644 Message: 19671

The correct voltage polarity on the VFO KEY socket is "Positive" not "negative". I think Stew must be connecting the meter leads incorrectly to the VFO KEY socket. If Stew's volt meter is a digital volt meter, connect the "RED" lead to the center conductor on the VFO KEY socket and the meter's "BLACK" lead to the chassis, the meter should display a "positive" voltage (no minus sign on the digital meter's display).

Stew have you checked your 2NT wiring from the cathode of V1A (pin 7) to the center conductor of the VFO KEY socket? If not then I recommend you do that using an ohm meter (all power removed/turned OFF and main power plug pulled from the wall outlet). You should see zero ohms from pin 7 of V1A and the center conductor of the VFO KEY socket.

The VFO KEY socket is used to turn the VFO "ON" so the operator can "Spot", hear the VFO signal in the receiver so the VFO is on frequency. Heathkit does the same thing with their VF-1 and HG-10 by grounding the rear panel "VFO KEY" socket, grounds the oscillator, turning it ON. Remove the ground and the oscillator turns OFF.. I use a relay to control the VFO KEY socket in my HG-10 VFO with my DX-40. The VFO KEY relay I used is part of my T/R switch (3PDT 120VAC) relay. The 2NT has a built in T/R relay so you would have to come up with a different circuit to shift the DDS VFO up during transmit.

Stew, have you considered that the DDS VFO output signal level may not be sufficient to drive V1A, the driver, and final amplifier? Quite often the DDS VFO's output signal level is around 200mv which is not enough to drive the buffer stage, V1A to a level the driver and final amplifier can use. I could be wrong but I don't recall seeing this discussed in the thread.

Yeah, this is right!You might need a buffer amp to raise the DDS level to drive the tubes..on the 75A-4 the PTO osc level to the mixer is 3 times greater than the DDS VFO output as seen on the scope..

Thanks for your comments Mike.

I have been using vom's and vtvm's, both analog and digital, for over sixty years but I do have my senior moments. Your email got me wondering what else could cause my apparent problem. Then the light bulb went on! I pulled the patch cord I was using and sure enough, the center pin and shield are reversed from one end to the other. (I don't know why) Anyway the problem is resolved.

The VFO outputs the operating freq until a pin on the controller is switched low. When that happens, the frequency shifts a programed amount. It's easy enough to use a manual switch to do this during receive but I want to make the process automatic.

The output of the DDS VFO I'm using has 1V PP open and .5V pp across a fifty Ohm load. I plan on using the Hagerty Buffer Amp to drive the 2NT. That should give me ample drive.

I want to thank everyone on the list for the help and I'll be sure to report any solution when I find it.

73,
Stew ke4yh

As for the level. The good news is that the 2-NT does not require a lot of drive. The driver from WA1FFL is an excellent choice. I'm getting about 10 V p-t-p into my DX-60. That should be more than enough.

Also. I had issues with RF on my original DDS VFO and needed to put shielding in the form of ferrite beads on the VFO's input leads.

Which DDS VFO are you using?

Good luck and let us know. 73 - ken K6CTW

Hi Ken,
I'll keep the RF issue in mind, Thanks.
I'm using the Arduino Nano and AD9850 DDS. The software sketch was
written by AD7C. Works FB on the breadboard. Wave looks good on the
scope and the calibration is real close on the freq counter. Now I need
to put together a chassis.

19676. TR4 PTO "Fast Spin" how far?

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-30 02:24:55 UTC
From: Steve VK2SJA
Topic: 19529 Message: 19676

Hi all,

As part of my ongoing TR-4C restoration I have completely re-furbished the PTO. Trouble is that because this TR-4C is the *only* Drake radio I have, I have nothing to compare it against.

So I know my re-furbished PTO is much better than before I started. But I have no idea if it is as good as it can be.

Now the "Drake Mods" guide (which Garey cautions against taking as pure gospel. So I don't). Says that you should be able to "Fast Spin" a properly working PTO. But by how much?

So I have devised this rather crude and simple test. If I align the PTO at the zero KHz mark with the dial marker. And then place my finger at the top of the tuning knob in-line with the dial marker. Then flick my finger downwards in a clockwize direction with as much force as I care to muster without getting silly. My PTO will spin/traverse about 50 KHz.

So the question to those that have a similar PTO (they are all similar but this is the one with the dual dials from a TR-4C).

Is this good, bad or average?

73, Steve.

I don't know what to say about "spin travel", but I can comment on how not to abuse these plastic gears. A long time ago I was using a TR-4 with brass gears. I had a habit of "spinning" the dial from one end of the band to another, which was OK and did not hurt anything. Then Drake came out with the C-line equipment and I purchased a new T4XC and a R4X C. I then started "spinning" the dial on my R4XC from end to end as I did with the older radio with brass gears. As I would spin the dial I would "bang" the gears on the end stop. It took three brand new PTOs to realize I was warping the plastic gears and causing them to bind by "banging" the gears on their end stops. As soon as I stopped doing this, I had no more problems with the plastic gears binding. So be cautious of doing what I initially had done to my Drake C-line gear. Spinning the dials is OK but don't "bang them on their end stops. As for amount of travel, my plastic gears never spin or spun as easily as the PTOs with brass gears. It's just a nature of the beast. One last thing, NEVER lubricate the plastic gearing as it is "self lubricating" and lubrication will "swell" the gears and cause permanent binding to occur.

The tuning knob is not weighted, so I would not place much concern over how far the tuning "spins" due to the flywheel effect.
If it feels velvety smooth (not gummy) and can be easily tuned with a light touch of your fingertip, I'd say your PTO is mechanically very healthy and happy.

Excellent, especially since you can program your band offsets etc. Definitely watch the RF both coming in from your transmitter but also the RF from the Arduino. I'd shield all the leads with beads and make sure the case was surrounding the units.

For cases, I've used the TenTec ones with very good success. Might want to look there for one.

Good luck! 73 - ken

19680. Restored R-4A

All - I've described the R-4A I got on eBay before. Well, after putting in a few new resistors that had gone out of tolerance, all the electrolytics (thanks Hayseed Hamfest) and a number of other caps and adding 2 tubes that were out, I got the rig running pretty well. I added in the crystals for the 160 meter band and also one for 28.0-28.5 MHz.

Today, I took it to a friends workbench, where he has a complete set of HP, RF test equipment, and did a full alignment on the rig. Boy is this receiver hot! I'm very impressed. The PTO is also super linear. Drift over an hour was negligible on the instruments (i.e. less than 20 Hz) and not noticable by ear. If we weren't having continuing aftershocks (his shack is about 2 mi from the epicenter of the Brea/La Habra quakes) I was planning on doing an MDS test and sweep the various bandwidth settings to get the filter characteristics. Also wanted to do the BDR testing just to see at 5 and 2 KHz. Maybe next time.

By the way, this is a 13 tube unit, 2xxx serial number. All in all another superb performer from the folks at Drake!

Folks,
In a conversation with Tom at Hayseed Hamfest concerning his loss of a supplier....he advised me he still has plenty of multi-section can capacitors in stock for the three "H" manufactured radios...Hallicrafters, Hammarlund and Heathkit. It is only the can capacitors for the Drakes that he is out of TEMPORARILY due to a supplier shutting down. He said "Be patient" because it may be a day or two, a week perhaps, or even a month, but he WILL find another supllier of the can. Just wanted to pass this along to the Drake group here....from Tom at Hayseed Hamfest. Thanks

20Hz is quite great! I see more like 200Hz drift from 5 minutes to 1 hour. MDS on mine close to .1uV, even on 10 meters. It's also interesting to measure RF to get S9 on the meter.

Um, who cares?? :-) That's what the 'spinner' button is for, you put your finger in the button
and scan the band!

This is kinda like 'how many digits does your display have?'.... How many mean anything??

As long as the frequency changes smoothly, without jumps, and stops when you stop turning, it's
great!

(I'm just old and crotchety!)

19689. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-30 17:07:47 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 19689

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

19690. Re: [DrakeRadio] TR4 PTO "Fast Spin" how far?

Yahoo group: DrakeRadio (2014-01 — 2014-05)

From: Barry
Topic: 19529 Message: 19690

Instead of a "how far will it go with a good spin", I would think the spec should be more on the order of how much torque is required to move the dial (which would be pretty difficult to measure on a properly-adjusted Drake PTO).

That said, the "changes smoothly, without jumps, and stops when you stop turning" statement below should be all that's important.

And that's my "I don't own any 4-Line equipment but like to comment anyway" $0.02. :)

I must be missing something here, as I've never had any
piece of Drake gear where I could freewheel the main tuning
by 50 kc. The C-Line is stiffer than the older ones and I
can't imagine getting any travel out of those! If you
loosen up the pre-C's enough to do this, the knob is going
to have a lot of axial play in it. These are pre-loaded
ball bearings and not roller bearings we're talking about
here...

73,

Steve Wedge, W1ES/4

I just started reading this thread and can't figure it
out either unless its really about some other piece of
equipment. The "drag" on the VFO of my TR-4, T4XB, R4B, are
all dependant on the adjustment of the bearing at the back.
When set to just eliminate mechanical wobble there is not
much drag but also the dial does not spin. I don't think
the dials of any receiver that is without a flywheel will
spin. Certainly, the dial on my R-388 does not and has a
drag adjustment under the knob. If you want spin try an
SP-600-JX with a clean gear box, next best is an RCA AR-88.
A lot of receivers had flywheels, even some of the cheaper
Hallicrafters sets. I don't think it adds much other than it
feels nice.

I still think the king of flywheel tuning is the National NC-300/303. After a cleaning and lube job, one swift spin will send the dial pointer from one end stop to the other. The single most silky smooth tuning knob I have run across yet.

From: David Stinson
Topic: 19696 Message: 19696

I wrote the fellow with the $3500 "Buy it now" Drake L-4 on Ebay
and politely directed his attention to the working, tested L-4
listed
for less than half the price and with free shipping.
I also politely reminded him that ham stuff and tube-audio stuff
were two different markets and price very differently.

He responded...

I THINK YOU SHOULD KEEP YOUR F***IN COMMENTS
TO YOURSELF, AND SHUT THE F*** UP!!

Someday, I will learn to mind my own business:

I'm sure he's fishing to find someone to pay him more than most of us would perceive to be it's worth, but in his defense, the first sentence in the listing says:

FOR THOSE WHO THINK THAT THIS IS THE SELLING PRICE, IT IS NOT THE SELLING PRICE. THE AD HAS "MAKE OFFER" TO ALLOW EBAYER'S TO MAKE A REASONABLE OFFER.

FWIW...and that doesn't mean he isn't a jerk, obviously...

I suspect that he is doing this because he does not want to set a reserve price(eBay charges extra for this).

You never know, there might be somone out there with the excess cash and shortage of sense to buy it at that price. Sometimes capitalism required a bit of audacity. I've seen many an auction go stupid high in price, and I just have chuckle that there were at least two people bidding at that level.

Still, his mother should have taught him better manners.

19704. Drake 4-NB (noise blanker for the R-4C)

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-30 23:40:16 UTC
From: <k6ctw@...>
Topic: 19704 Message: 19704

A general question for the group. I have a 4-NB in my R-4C but on a vintage net, they mentioned that these units are unobtanium. I've done a little checking and that appears that he is correct. So, I wrote to Drake and asked if they could provide information on the coils and they said they didn't have it anymore. Thus, what I plan on doing is taking measurements from the ones on my 4-NB. I'm currently in the process of re-drawing the schematic in to Express PCB package and may follow that with a layout once I get all the appropriate information. I'll let the list know what I find out about making a direct replacement and the layout and parts costs if that can be determined. An interesting experiment eh?

Now a question for all of you, Does anyone have any idea of what original units go for now on eBay? That will give me an idea of wether this is a worthwhile exercise of just a waste of time. Thanks in advance for any advice/comments/etc.

73 - ken

PS - same goes for the 34-PNB noise blanker for the TR-4 series?

19707. UV-3 Au Natural

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-31 00:01:21 UTC
From: Jim Shorney
Topic: 19707 Message: 19707

So a nice UV-3 found it's way into the fold yesterday. As I am playing with it on the bench I noticed that the LED behind the MHz digit was much dimmer than the others, so much so as to be all but invisible in normal room lighting. So I decided to change the LEDs out and I decided to try white LEDs just for fun, to let the numbers assume the natural color of the plastic dials. Those of you in the know are probably chuckling already, but I think it looks quite nice and is highly visible.

So, as I am doing this I drop an LED into the bowels of the front of the radio. Rather than unhook all my wires and move stuff so I could flip the radio over and shake it, I decided to just remove the four screws and pop the "control head" off. As I was doing this I heard something rattle that definitely did not sound like an LED. What it sounded like was a loose "U"-shaped piece of aluminum that was caught up by one of the plastic dials. I successfully extracted it, but I cannot figure out where and if it belongs in the radio.

If anyone out there is intimately familiar with the UV-3, could you please take a look at the photo that I have posted in the group photo section of this undicumented resident and see if it looks familiar to you? I strongly suspect that it is not supposed to be in the radio. You can also enjoy a photo of my "natural" dial lighting while you are there...

19708. For Sale: Early T-4 Transmitter

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-03-31 00:17:03 UTC
From: Steve Wedge
Topic: 19708 Message: 19708

I've seen some other ones for sale online recently - figured I'd offer this to you guys first before putting it out into the Interwebs.

This is a very early T-4 Reciter, serial number 0017. The factory apparently had switched to using a 6AU6 in V3, but their stencil on the chassis was probably "6HS6" - they put a label over the original silkscreen, with "6AU6" in the same stenciling. The RF TUNE knob is a regular lined knob and it directly drives the coil rack. I estimate it was built in late 1965, the Sylvania tubes in it are coded "518". Finals were replaced at some point, because their code starts with "3", which I would guess would be 1973 or 1983. The neutralization was also off when I got it, suggesting the previous owner simply replaced the finals and didn't bother re-neutralizing.

The chassis is in very good to excellent condition. There are a few "freckles" but no real corrosion is evident anywhere. Front panel is excellent and the covers are some of the best early covers I've seen! Output is a solid 120W on 80, 100W on 20 and about 80W at 28.7 MHz.

I've been playing with it for a few days and it's working great. I did an alignment on it, lubed the switches, used a little Cramolin on the contacts and dusted off the inside. This one was so clean that it did NOT need to be washed! It's over 95% original: the finals were replaced at one time and I replaced V3.

Asking $550 plus shipping. Photos available and will also be posted in the name of general interest. My shack and wallet are too small for me to keep it and I probably won't see another one for a long time.

I have a bhp dsp module hooked up to my Drake tr7 and it does a great job. Admittedly, my tr7 also has the noise blanker. I think I would try an external dsp device to see if I could get by with that for noise reduction. I'm sure it would do well and cover a lot of things the NB might not. Plus its cheaper than an ebay board. I got mine for about 150 bux if I remember correctly. There are a few varieties of dsp's out there to choose from. YMMV

Subject: [DrakeRadio] Drake 4-NB (noise blanker for the R-4C)

A general question for the group. I have a 4-NB in my R-4C but on a vintage net, they mentioned that these units are unobtanium. I've done a little checking and that appears that he is correct. So, I wrote to Drake and asked if they could provide information on the coils and they said they didn't have it anymore. Thus, what I plan on doing is taking measurements from the ones on my 4-NB. I'm currently in the process of re-drawing the schematic in to Express PCB package and may follow that with a layout once I get all the appropriate information. I'll let the list know what I find out about making a direct replacement and the layout and parts costs if that can be determined. An interesting experiment eh?

Now a question for all of you, Does anyone have any idea of what original units go for now on eBay? That will give me an idea of wether this is a worthwhile exercise of just a waste of time. Thanks in advance for any advice/comments/etc.

73 - ken

PS - same goes for the 34-PNB noise blanker for the TR-4 series?

The Radio Shack DSP that they made in the late 80s or early 90s always worked well as an external device.

I have a bhp dsp module hooked up to my Drake tr7 and it does a great job. Admittedly, my tr7 also has the noise blanker. I think I would try an external dsp device to see if I could get by with that for noise reduction. I'm sure it would do well and cover a lot of things the NB might not. Plus its cheaper than an ebay board. I got mine for about 150 bux if I remember correctly. There are a few varieties of dsp's out there to choose from. YMMV

I have an old DSP-9, which I tried on my 2-B and it was really not that effective on the noise I have here. The one on my R-4C is very effective on the noise around 3.550 MHz (any ideas as to the sources for this frequency?). The one on the R-4A is not as effective on it. Probably cuz it was designed for ignition noise and the R-4C was probably there to help with longer pulses like those from the "woodpecker" over-the-horizon radar the Russians had in the 60's 70's and 80's (till Chernobyl blew up as that was their primary source of power for the array, or so I've been told).

Anyway, having a duplicate original for your new/old R-4C sounded like an interesting idea but at $250 for one, it may not be cost effective. I'll let you all know.

Ken:

I purchased mine on eBay last Summer for $165. The unit was in excellent condx and it was truly plug and play for me. That is the only 4NB I have seen on eBay since, so there are not a lot of them being traded out thee.

Last Spring, a good friend of mine gave me his son's old ham rig. That just happened to be a Drake C-line. And it looks great on my operating table next to my Drake A-line! I had heard that the 4NB was a fantastic noise blanker, so I went to looking for one on eBay, and just got lucky, I suppose. I don't think there is much competition for them; at least that was my feeling after winning the auction.

BTW, I recently purchased a 34-PNB for my Drake TR4CWrit on eBay. Cost was $245.

Hope that helps.

Mike,
I have one, and am in process of divesting from all of my excess tube radio gear. It is ONLY the station console, there are none of the external parts there, that normally go with it. It does have the display replaced, nicely done, too, with a blue L.E.D. display.
I overpaid for it, not realizing that it was incomplete. I paid $250 plus shipping. But that's not your issue. It's in great shape, but needs the power strip, and actual tower top antenna switch box.
I think $150 is a very fair price, and if you're interested, I will get it out, and get some photos for you.

Would require a very accurate wattmeter at both 200 and 2000
watts, a stout dummy load and an amp capable of 2KW WOULD be
my guess.

You need a good dummy load but can measure power in
terms of voltage across the load. For this you need a good
T connector. The RF voltmeter needs to be reasonably
accurate but a meter like the General Radio `1800A/B or
Hewlett-Packard 410-B or C will do. The power is simply
P=E^2/R. If you have access to a good RF impedance bridge
you can check that the dummy load is at 50 ohms and is
non-reactive. you can calibrate the watt meter at its lowest
frequency to eliminate as much as possible the effect of
stray reactance. The cables should be as short as possible
and the voltage measured as close to the dummy load terminal
as possible.
While the voltmeter may respond to harmonics those are
usually quite low from most ham transmitters.
You do not have to set the trimmer at full scale
although that is best. A mid scale setting is usually good
enough. Unless you think the wattmeter is inaccurate I
would leave it alone.

Jim:

I just opened the UV-3/144 (serial 297) I have on my service bench and no joy – nothing that looks like what you show in the pic.

There is a “similar” shaped wire tool for removing the boards loosely tucked into a clip in the speaker compartment, but you have already discounted this where yours is concerned, unless someone attempted a homebrew version and missed???

There is a 1/4” wide aluminum u-shaped (of sorts) band over the back of the meter – one end is riveted so not likely going to fall out on its own. Other end has a screw in it.

I even pulled the 4 panel screws and removed the front panel from its edge connector – no wayward anythings!

Sorry – best I can do. I can try opening one of the 3 band versions tomorrow evening but doubt that will turn up anything.

Subject: [DrakeRadio] UV-3 Au Natural

So a nice UV-3 found it's way into the fold yesterday. As I am playing with it on the bench I noticed that the LED behind the MHz digit was much dimmer than the others, so much so as to be all but invisible in normal room lighting. So I decided to change the LEDs out and I decided to try white LEDs just for fun, to let the numbers assume the natural color of the plastic dials. Those of you in the know are probably chuckling already, but I think it looks quite nice and is highly visible.

So, as I am doing this I drop an LED into the bowels of the front of the radio. Rather than unhook all my wires and move stuff so I could flip the radio over and shake it, I decided to just remove the four screws and pop the "control head" off. As I was doing this I heard something rattle that definitely did not sound like an LED. What it sounded like was a loose "U"-shaped piece of aluminum that was caught up by one of the plastic dials. I successfully extracted it, but I cannot figure out where and if it belongs in the radio.

If anyone out there is intimately familiar with the UV-3, could you please take a look at the photo that I have posted in the group photo section of this undicumented resident and see if it looks familiar to you? I strongly suspect that it is not supposed to be in the radio. You can also enjoy a photo of my

"natural" dial lighting while you are there...

19735. L4B Issues

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-01 14:34:24 UTC
From: Bill Gaines
Topic: 19735 Message: 19735

I am shopping for a replacement plate transformer for my L4B. One side of the primary has opened up and it is the low power (cw) side. The amp and power supply still work in the high power (SSB) position. At this moment what are my chances of finding one here?

I did locate one but the owner has refused to ship it even though I am footing the bill.

Why not have it rewound? Heyboer can do a great job at a fair price.

Right now what I have found is $452 for rewinding. This does not include shipping. What I have also found is a complete supply where the seller is unwilling to ship but he wants $400 for it. It is several hunderd miles from me so it isn't practical to pick it up. Perhaps there is a used but working xfmr out in cyberspace where the seller is willing to ship it. I don't think Heyboer is where I originally checked. I will Google them and check their prices out.

Thanks,

Have you checked Ameritron's transformer offerings? I know they have one for a lot less than $400, that people have used in the SB-220. The footprint may not be identical, but surely they have something that meets or exceeds what you need.

I recently acquired a TR-3 from a SK Estate. The plastic dial face is badly warped. It appears to be the same as a TR-4. Any tips on flattening it out or does anyone have a good one for sale?
Also acquired a TR-4, MS-4 and AC-4.

19748. My new T4XC, sage from dead to ALIVE! (long)

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-02 00:44:03 UTC
From: <rochep@...>
Topic: 19748 Message: 19748

Just got my first Drake transmitter, a T4XC in "unknown" condition, to pair with my "new" R4A. Got an AC4, checked AC4 voltages and it seems OK (still need to re-build with HeathkitShop kit). Tried to TUNE up TX, NO LUCK. Here is a sort of summary of my findings and Garey's help via email. Maybe someone else might find similar things and maybe this will help (I am Paul Roche!). Garey is great and was EXTREMELY understanding in helping me try to "understand" what was going on. I really appreciated it!

Paul Roche wrote:
With variac is at 115 V the TX makes a kind of "squealing" sound when on SSB. Not super loud, but I don't think its normal. I ignored it the sound (not knowing what). But when I went to try to "tune" it up by increasing the RF GAIN control there was NO increase on the meter. Something is wrong.
Paul Roche wrote:
The noise came from the 12BA6 tube. The 12BA6 tested bad in my Superior TV-11 (seemed DEAD). I put a new 12BA6 in and the noise was gone. All other tubes tested good (did not test PA tubes). But still increasing GAIN in TUNE mode does NOT give any increase in the meter. (Garey thought this was strange, maybe I should try "tuning" in CW mode).

Paul Roche wrote:
A straight key is plugged in but not keyed (yet). When I switch to TUNE I get the 70 mA idle current. All good. But when I then simply switch to CW the current goes to about 100 mA AND THEN IT GOES TO ZERO mA! Even with GAIN to MAX the 100 mA NEVER moves (when keyed in CW), regardless of what I do to PLATE, LOAD, RF TUNE, or GAIN control.
I measured all voltages. V2 plate (pin5) reads 80V instead of expected 240V. B+ comes through R25 (1.5K), I will see if it drifted high.
V2 (pin6) reads 44V instead of expected 95V. B+ comes through R26 (47K), I will see if it drifted high.
V2 (pin7) reads 0.8V instead of 2.2V. Not too bad but ...
V10 plate (pin1) reads 47V instead of expected 105V. B+ comes through R65 (100K), I will see if it drifted high.
V10 plate (pin7) reads -0.5V instead of expected -0.1V.
GARY RESPONDED:
Something bad wrong with V2. Pin 7 voltage LOW indicates that the stage is NOT drawing expected current. Does NOT account for low plate voltage though. Are you sure you have a good V2? (I am sure it is good) What happens to those voltages when you pull V2? I'm a little concerned about a short to ground in T2. Is there voltage drop across the Primary of T2?
Paul Roche wrote:
Here's whats going on. Poking around looking and tracing I found this burned component (sent picture to Garey)!!!
What is also strange is that B+ is 250V on one side of R65 (as expected) but only 47V on the other. Something seems amiss with R65, right?
I cannot determine WHAT is R66, that is why I need the manual!!
END OF STORY:
Gary told me it was R25 that was toast. EITHER Plate to Grid short in V2 or T2 is shorted.I

replaced R25; ALL GOOD NOW. I still have not ventured to check voltages around V10; I will wait to rebuild my AC4 before I do that.
But now it tunes up as it should, I can get 130 watts into my dummy load on 40CW and made my first QSO last night. Next thing, re-build AC4, re-check voltages, and try to align.

Hopefully this can help somebody. It sure was strange having the GAIN control do NOTHING.
paul

I have a TR-3 that has a bad soupcan filter. I have thought about either parting it out, selling it as a parts unit, or trying to find an early TR-4 filter to replace it (I'll have to review Garey's notes from a few weeks ago to see if TR-4 filters will sub and fit). Maybe this is the time to make the parting of ways decision.

Put the dial between some sheets of waxed paper, then sandwich that between some plate glass or other smooth, flat objects. Then place all that under a weight, and leave in a warm place for a while, such as over a heat register or even above your radio gear for a few hours. Lacking anything else, using a kitchen oven on its lowest setting, WITH THE DOOR LEFT OPEN, for a while should do the trick. The waxed paper is to prevent the lettering on the dial from coming off and transferring to the plate glass. Disassemble the "sandwich" while still barely lukewarm. Do not open when hot.

From: Jim Shorney
Topic: 19707 Message: 19754

Thanks for looking, Peter. The band behind the S-Meter in this one looks like spring steel, and is held in place by its own tension. So there's an interesting difference.

I didn't see the unknown item until I looked in the bottom of the control head, and it looked like it was caught up in between the dials and the front panel. I thought maybe it might belong there for some reason, but I can't imagine it being that loose.

Serial numbers on this unit are 10xxx for the main unit, and 979 for each of the two rear modules.

seems like you don't have anything to lose by trying . maybe putting it between 2 pieces of heavy glass and leaving it in the sun . just watch it so it does not melt . you could also send it to radio daze and see if they can duplicate it . ask them before you send it .

Garey,

My apologies if this shows up twice; I posted a reply via my email on Sunday but it never showed up here, therefore I am posting it via the Yahoo page.

Garey,

I am using the Kits and Parts Wide band amplifier to amplify the N3ZI DDS output. It has winding instructions for 50 ohms and 200 ohms for the output. I have tried both iterations and still have a significant sensitivity issue; I have a loss of 2 to 4 S – Units, most significant on 10M.

The wideband amp output is 3.8 Vpp on 160, 80 and 40M. 3Vpp on 20M, 2Vpp on 15M and 1.5Vpp on 10M. These voltages are unloaded; not connected to the receiver. Connected to the receiver I get about a 1 volt drop on all bands but 10M drops a little farther. I am using low capacitance cable to connect the amp to the injection jack. I have measured the P-P voltage from the T-4XC injection jack and the amps output is fairly close.

I am at a loss as to the next step. I am thinking about a two stage amplifier in an attempt to generate about 6Vpp; if I can get the sensitivity issue resolved then I will attenuate the voltage until the sensitivity just starts to drop off. My elmer mentioned this technique with old VFOs on some other rigs and I thought I may give it a try due to the fact that I have no clue where to go next.

Any suggestions here?

Thanks for your time,

Doug – N9XTF

19757. Just How Many?

Yahoo group: DrakeRadio (2014-01 — 2014-05)

From: lane denune
Topic: 19757 Message: 19757

Greetings Group ; I have a possibly easy question concerning tuning of T4/TR4 any. How many Khz, up or down frequency from presently tuned up at, is safely tolerated by the PA before a need to re-tune and re-dip? I have a KWM-2 also and the manual says as much as 15Khz on 80m to 200Khz on 10m before re-tuning is required for that model. I don't recall ever seeing such specifics mentioned in my Drake transmitter manual(s)..

I am sold on re-tuning and running my Drake equipment conservatively but I would appreciate any input on the matter.

Thanks and 73 from Lane in Columbus Ohio. de n8aft

Lane -

Welcome to the group!

The amount of frequency shift without retuning varies from band to band, as the KWM-2 manual
says. Those numbers are realistic, and a good guideline. However..... (there's always a 'however'!) The most important thing you can do to get maximum life from PA tubes is to be sure
that the PLATE is ALWAYS 'dipped'. If the LOAD control is off a little, you'll just see a little less output. Same for the RF TUNE control. But any power lost by undipped plates is HEAT
in the PA tubes.

So the short answer is, 'yes, you can move around without retuning', but your PA tubes will last
much longer if you just touch up the plate dip as a matter of course.

A small fan, blowing OUT either on top, or on the back of the PA cage will also greatly extend
PA tube life. A small, SILENT PC fan will move plenty of air, many run a fan on half its rated
voltage.

Lane,

One of the gurus will answer you shortly.

One of the big factors is how broad banded your antenna is. My 80 meter antenna is very narrow and pretty much any frequency movement requires adjustment.

On 10M, where my antenna is quite flat across the band, at a minimum I always re-dip the plate. This is a quick adjustment and should help preserve the 6JB6 tubes as they are on edge anyway. I let the amp go a little farther before I retune it but if I move 10Khz or so I retune. I assume this also helps reduce splatter.

73,

Doug - N9XTF

Gee, I hate to be a "Johnny-come-lately", but I must concur, that dipping the plate, is of paramount importance, to PA tube life.
And, at the cost of tubes, these days, that is mighty important.

Paul,
I think the entire list, would happily buy out every tube we could afford, at those prices. I haven't seen a 6JB6A for those prices since the 1970's. Right now, the best source is RF Parts, and they're closer to $40, than they are to $4, from RF Parts, depending on matched pair, brand, etc. remember, that tube height is VERY, VERY IMPORTANT, when it comes to tubes in the PA of a Drake radio.
But, I do have to think, that you are possibly getting tube numbers mixed up. I'll have to go look at those prices.

Doug -

You're running into the low-pass filter on the DDS, and compounded by the bandwidth of the amp.

To reach 29.0 MHz on the radio, your INJ is at 34.55 MHz. The 'ZI filter is specified for 'operation up to 34 MHz', implying that the output is down at least 3, perhaps 6 dB at 34 MHz.
This is necessary to produce a 'clean' signal since the DDS 'image' is at 45.5 MHz, which 'ZI
specifies as down 40 dB. I don't know what test equipment you have available, but I would be
inclined to bypass the output filter on the 'ZI and see how well the image frequency is suppressed in the receiver PreMixer and Mixer stages. It would be a little trickier in the transmitter, we don't want spurious outputs just a few MHz away!! It may be possible to modify
the output filter in the 'ZI, moving the cutoff up just a bit to get 'some' attenuation of the
image.

The amplifier is specified as '2-30 MHz', begins to roll off about 20 MHz, and is down 3-5 dB by
35 MHz. So it's easy to see why it's down that far on 10M! :-)

Paul,

Stuff happens. I bought four of them one time, NOS Lifetime Radio Shack. The boxes said 6JB6 but low and behold the boxes were mislabeled and they were 6BJ6. Right size boxes, as the BJ version is much smaller.

Doug

Garey,

I am using the Kits and Parts Wide band amplifier connected to the DDS. It has winding instructions for 50 ohms and 200 ohms for the output. I have tried both iterations and still have a significant sensitivity issue; I have a loss of 2 to 4 S – Units, most significant on 10M.

The wideband amp output is 3.8 Vpp on 160, 80 and 40M. 3Vpp on 20M, 2Vpp on 15M and 1.5Vpp on 10M. These voltages are unloaded or with the amp not connected to the receiver. Connected to the receiver I get about a 1 volt drop on all bands but 10M drops a little farther. I am using low capacitance cable to connect he amp to the injection jack.

Any suggestions here?

Thanks for your time,

Doug – N9XTF

OK! You win! :-)

Shoulda been p-p...

You could try a 50 ohm termination and a coupling capacitor. A ferrite bifilar matching transformer would be more efficient.

Garey,

I cut a snipped from a previous thread; it’s of no consequence but this is why I was chasing 2Vrms, LOL! If 2 Vpp will take care of it then I wonder why my sensitivity is low on 10M. The output waveform is clean and undistorted, I wonder if the impedance mismatch may be to blame here?

Thanks so much for your help!

Doug – N9XTF

Quoting Garey Barrell

Doug -

I haven't tried it, but the first step would be to determine the input impedance of the INJ jacks on the R-4C and T-4XC.
Then a simple transformer will probably suffice. You need about 1.5 - 2 VRMS at the PreMixer frequency (7.3 - 35.6 MHz)
into either INJ input.

You might take a look at the PHSNA project Yahoo group for ideas. We used either a 2N5109 buffer or an MCI ERA-3+ MMIC
to get about +10 dBm into 50 ohms (0.7 VRMS) from a 9850/51. You need about +20 dBm _into 50 ohms_. I suspect the
input impedance is considerably higher, allowing use of a simple transformer to get the higher voltage.

Really not nearly as simple a project as it looks, to do it right. Do you REALLY need to know your frequency to better
than +/- 100 kHz?

Doug -

One of us has made a mistake! The INJ signal level is 2-3 V peak-to-peak, not RMS. The impedance is 100-200 ohms.

To Doug N9XTF,

Occurs to me, you could wind several output coils for each band, and set them up in parallel, for proper output. Since they are all working on the same signals, the crosstalk is zero, and since we are working for the proper impedance per band, the out of band coils will by higher impedance and won't produce other kinds of gain problems.

Think of it as a stub-tuned mulit-band antenna <grin>!

19775. Help with Drake 2CQ Q-Multiplier

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-03 04:16:40 UTC
From: <kw6gchas@...>
Topic: 19775 Message: 19775

Bought a Darke 2CQ from eBay. The Q multiplier is not working; as advertised

Switches and cables checked okay.
Tube (12AX7) checks good; substituted 2 others with no change.
Coils were checked with ohm meter for continuity and okay
Resistors within tolerance.
Have not check caps, but am starting to think of just replacing ones near L2.

Symptoms when trying to perform alignment per Drake instructions in 2C manual: Cannot get any peak from adjusting L2, but can get a slight peak when adjusting L1.

Nothing much left to do but start replacing disc capacitors.

Does anyone have any suggestions? Any assistance would be greatly appreciated.

Thanks for all the input guys! Yes, I'm a stickler for the Re-Dip and have a fan top mounted over the PA and drawing warm air out. Generally I run the T4X at 100w output on CW and the air being exhausted is warm, not hot.The current is over 200 but under 275 key down. I have also found that adjusting the RF Tune for max signal into a digital receiver gets that important first tuning adjustment right on. 73 from Lane de n8aft

Yeah, hold on there. With the troubleshooting you have done, it probably IS working. 'Shot-gunning' is never a good idea!

The problem with a Q-Multiplier is that it is SHARP. Once you've done it a time or two, it's
easy, but ...

Essentially it's a regenerative 'receiver', and the controls have to be set carefully. The adjustments also interact.

I assume you have also checked the DC voltages per the chart in the manual. If not, do that first.

THEN..... READ the first sentence in the Operating Instructions for the Q-Multiplier on Page 28
of the 2-C receiver manual.

Now, follow the directions very carefully, exactly, step by step. If you come to a problem in
the directions, post the symptoms.

I would be willing to bet that it IS working, and we just have to get the operator working as
well!! :-)

Thanks Gary

How much of a peak should I see when adjusting L2?

Does the crystal calibrator signal need to be zero nested exactly for this to work? I would not think so.

I will start by confirming the voltages on the 12AX7 and them carefully follow the directions - slow and methodical.

Thanks for your help

19779. Replacing the Drake PS-7 AC Power Cord

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-04 02:45:10 UTC
From: Joe Burch
Topic: 19779 Message: 19779

Hi folks - just a quick question.

I need to replace the power cord on my PS-7 because the lid who previously owned it cut off the ground connector. To do the job properly, the P/C board on the rear panel should be removed. It's apparently fastened to the rear panel by the power switches themselves.

Has anyone tried to remove this board? It looks to me as though the screws holding the switches have been broken off so that the metal power selector (with the cut outs) will fit flush on the rear panel. I find it hard to believe that the Drake Company would manufacture a product like this.

Any thoughts?

Wouldn't it be easier to just install a 3-prong plug on the existing cord?

I believe those are either PEM studs or rivets, it's been a while since I looked. The PC board was likely a cost saving measure to reduce assembly time and labor over the early hand-wired version.

I agree with the other comment, go to the hardware store and buy a heavy-duty plug and repair the existing cord.

Gary:

You were right!

After I got home from work, I carefully reviewed all the measurements and they were right. So I took your advice and VERY carefully went through the alignment step by step. Took a little doing, but I got it right and the thing does work...

Thank you so much for your help....Much appreciated!!

Hi Charles
I have had 2AQ and 2BQ, and their controls were best learned with a calibrator signal. I peaked the signal on the S-meter, then tried each control separately and in combination to peak and null the signal. As said earlier, the adjustments are critical and do interact a lot. Once I got the hang of it, I could get a deep null and also got good peaking. I used the notch(null) on SSB mostly and the improved selectivity(peak) on CW. It can be frustrating until you get it sorted out, but its worth it.

He probably cut off the ground pin to eliminate a ground loop that was putting a hum on the audio and microphone output. If you ground the set up through another path, then don□t worry about the missing ground pin on the power supply.

I believe those are either PEM studs or rivets, it's been a while since I looked. The PC board was likely a cost saving measure to reduce assembly time
and labor over the early hand-wired version.

I agree with the other comment, go to the hardware store and buy a heavy-duty
plug and repair the existing cord.

The 2C manual suggests the same thing - use the calibrator signal. I did that for the alignment procedure.

Tested the unit listening to 40 meter CW. Seems to work rather well, but you do need to practice a bit to get the hang of it.

With that said, the really confusing thing is the rather broad peak you get when adjusting the L2 coil during alignment. This is on the notch part of the circuit; actually looks like input from the receiver. Does anyone know if that is normal? There is really not much to go wrong with this circuit; only a few components.

Thanks for your thoughts and advice.

Charles -

Great!! The Q-Multiplier is one of the simplest, most effective devices for radio communication
EVER! :-) It makes use of 'regeneration', a technique invented by Major Edwin Armstrong exactly 100 years ago. The regenerative receiver can, with ONE vacuum tube, compete favorably
in sensitivity with today's $10k super receivers!

The basic theory is that if you take an amplifier, and sample a small amount of it's output signal and feed it back to the input, the same amplifier can amplify it again. And again, and
again. The precise amount of feedback is very critical, as obviously if you have TOO much, you
have an oscillator. Beside increasing the GAIN tremendously, this increase in gain peaks at the
resonant frequency, resulting in a narrower overall bandwidth or increase in selectivity. Further information is available at the Yahoo group 'REGENRX', another list I moderate.

The Q-Multiplier works by converting one of the IF stages of a receiver into a regenerative amplifier, GREATLY increasing its selectivity. Conversely, it can employ the same technique by
inverting the signal and causing a very deep 'hole' or null at the resonant frequency.

So your Q-Multiplier employs one of the first inventions that not only enabled radio communication, (just after the crystal set,) but is still useful 100 years later......

Not too shabby.....

The adjustment of L2 is to compensate for the loading of the coax to the IF Amp in the receiver. Depending upon the selectivity of the IF, it will typically be quite broad. If you
are crazy, (like me,) you'll tune L2 for the same S-Meter reading on either side of resonance
and then count the turns to set it to the middle. Normal people set it somewhere near the middle and let it go!

Hi Jim,
Thanks for taking then time to reply. It looks like they are PEM studs with the heads of the screws sheared off so that the plate over the switches that set the input voltage will fit flush. I'm surprised that Drake did this as there could be a later need to replace one of those switches or capacitors - unlikely - yes, but possible. Whoever designed the thing should have his knuckles rapped with his slide rule.

Joe -

I think your punishment is a little excessive.

While perhaps not the ultimate in design goals, consider that 99.9% of those switches will NEVER
be used, AND if they are, it will occur with zero power applied.

May not be all that egregious, all things considered.

19791. How the heck do you adjust the notch transformer?!

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-04 16:44:13 UTC
From: Steve Wedge
Topic: 19791 Message: 19791

I'm working on an early R-4 that has a seriously out-of-alignment notch filter. Most of the rest of this set was pretty much bang-on, aside from this notch and the PBT slugs. The PBT was a piece of cake.

Not so, this notch. Usually, I get a good enough response from the notch where I don't even have to think of adjusting T-8. However, in this case, I have to do it. The adjustment is at the front, about 1/2" behind the front chassis! Is there an adjustment through the rubber ring in the back? If so, which tool (hex, straight, other?) I don't want to damage the slug.

Yeah, I was looking at it, and if it was the slug position, you should be able to find a null - it would just be at a different setting. This one gives a very shallow null, and adjusting the pot does little.

Back to the soldering iron - after I get done with all the real estate that just came up!

Topic: 19791 Message: 19795

Both SM's measure about 4000 pf, in-circuit. The coupling caps C60 and C69 seem a bit off, but those should not be critical.

I guess we could still have a bad SM cap in there. R14 is measuring about 11.5k, so that shouldn't really be an issue, since the pot could take up that tolerance.

Yeah, I was looking at it, and if it was the slug position, you should be able to find a null - it would just be at a different setting. This one gives a very shallow null, and adjusting the pot does little.

Back to the soldering iron - after I get done with all the real estate that just came up!

Steve -

Highly unlikely it needs adjustment. More likely one or both of the 3000 pF caps C67, 68.

I tend to agree. I've had my own issues with PEM stuff, but that's another story. They are common enough, and have a place in the world. It's not at all uncommon at all in the industry for parts that are imagined to have a very low failure rate to be mounted in ways that, while not especially easy to replace, are more convenient and/or cost effective from a manufacturing standpoint. I will admit that I had a bit of a "WTF?" moment when I first saw that, but I imagine the repair procedure would be to carefully de-solder each of the switches and pull the board away.

Drake probably thought that the plug on the end of the cord would likely fail before the switches. I'm sure it would be perfectly OK with Bob Drake to replace the plug. How do you think folks that do run the PS-7 on 240 volts / overseas power deal with it? I'm sure that not everyone runs out and gets an adapter cord for USA 3-prong.... :)

Just FYI … your situation may be different since you don't see much of a notch anywhere.

I'm working on an R-4B. The notch nulls fine, but at about 10:30 instead of 12:00 straight up, the result of which is that it won't notch across the entire passband. I did check these caps, and found one that was at the extreme of the specified tolerance (3160 pf). So I replaced them both, but nothing changed materially. The 5% caps I put in measured about 3050 pf each.

I do plan to put my sweep gen on the passband to see exactly where the notch thinks it is over the weekend (and also take a look at the IF overall because after alignment per the book LSB is clean and USB is muddy). But I have a feeling that I'm going to be fiddling with that springy tail to bring the notch into alignment.

I presume the spring turns like a screw in the small rubber (?) bushing that attaches it to the mechanical mechanism, and I'll bet it won't want to turn easily. Need to find really really small fingers :)

Looking at the circuit, it appears to be completely passive, so changing tubes shouldn't affect the Q of the thing.

I do remember having a hell of a time with a PBT that wound up being the 0.1 uf metal film cap at the output of the filter.

Even though my 10k resistor is a bit high, I'm figuring the pot has more than enough range to compensate for it. So, I'm left with: the coil, the SM caps, the resistors or the coupling caps.

Perhaps I'll get the time next week to dig into this.

From: <rochep@...>
Topic: 19800 Message: 19800

I just did the Heathkitshop AC4 upgrade; the AC4 was working "fine" before but I had $70 burning a hole in my pocket. hihi
All seems fine, voltages are fine. But I notice when I switch to TUNE or key the T4XC on CW I hear some "hum", almost like a vibration in the PS. Doesn't happen in "standby" SSB. This is not hum picked up on a RX, but literally the sound. I made sure transformer was tight to chassis and new PC board/standoffs are tight, that's not it.
I am not TOO concerned, but is this normal? I don't remember it happening BEFORE the upgrade, but maybe at age 51 I am beginning to forget what I remembered from last week!

Yes, I’m sure. I’ve been through it twice, and other than the notch it aligns just like it’s supposed to. A third time won’t hurt :)

I’ve had other R-4Bs, but never had one with the notch so far out of whack. That’s why I plan to put a sweep generator on the whole IF, and see if anything looks squirly. The PB tuner “sounds” ok, but it will be instructive to look at the actual passband. It could be that someone else messed with it in the past, but it didn’t look molested in any way.

If I find anything particularly interesting, I’ll post the result.

73,

Steve Wedge, W1ES/4

I had to look. It seems to me that I adjusted this when I first got my R4B. If you look down the back of the coil with a dental mirror you will see a socket. It seems to fit a 1/16th inch Allen wrench. I was able to reach in with a ball head hex wrench. I did not try to move the core because its in the right place. If you have a plastic adjuster the right size I think it would be less likely to fracture the core than a metal wrench. I also did not investigate if the wrench affected the tuning but a metal wrench might. I don't remember the details. I don't know if your receiver is the same as this one.
The one problem I have with the notch filter is that the wire or rope of whatever is the right term for it that moves the core tends to rub on the inside of the case so it makes the notch difficult to adjust. One day I will get the cover off and see what can be done. When its adjusted right the notch filter is _very_ good.

19804. transmitter section of TR3

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-05 04:57:46 UTC
From: John King
Topic: 19804 Message: 19804

I have a TR3 with a transmitter section problem. The receiver section works well but the transmitter does not. Voltages all are as they should be. All tubes specific to the transmitter have been substituted without change in non performance.

Keying up the transmitter does not produce any signal in an adjacent receiver tuned to the same frequency. Problem is as if a critical oscillator or mixer in the transmitter section is not working. Keying up the transmitter produces 50 ma. idling current in the 12JB6 finals without drive to the finals because there is no drive getting to the finals.

Has anyone experienced this problem with the transmit section of a TR3 or TR4 when the receive section was working properly. If so, please share your findings regarding the transmit section problem, Thanks and 73, John, K5PGW

I have two AC-4 supplies with the Heathkit shop kit in
them. Neither vibrates. The usual cause for this is loose
transformer laminations. Its possible the bolts compressing
the laminations were loosened in the process of mounting the
circuit board, they should be clamped quite tightly. You can
try removing the board and tightening up the nuts on the
transformer. I also suggest making a simple stethoscope
using a wooden dowel. Similar listening sticks are used by
auto mechanics and were common in the telephone plant to
listen for misbehaving relays. Even a fresh (long) pencil
will do. Use it to localize the hum. The reason it doesn't
happen in standby is that the current drawn from the supply
is less so the magnetic fields in the transformer are less.

Hi Vic,

That makes no sense... I don't think they know anything about the set.

It has an internal mains-powered supply, & the transformer can be wired for 120 or 240v.

There is an "accessories" power socket on the rear panel which supplies 6.3vac & 150v DC... they may be mistaking that for the power input.

Incidentally, I have an R-4B in excellent condition that I don't use much these days. I paid over £300 for it on Ebay a few years ago & I don't really want to lose money on it. Having said that, irrational though it might be, I'd swap it for an absolutely mint AR-88, D or LF. It has to be in perfect condition, mind. :-)

From: Steve Wedge
Topic: 19791 Message: 19808

50 kHz oscillator was zero beat with signal generator and verified with a Fluke counter that I know is good. The oscillator only needed a tiny adjustment. The PBT carriage was way off but is now correct.

The notch nulls in approximately the right place but is only about 10-20 dB.

I've never seen SM caps go bad this way. Symptoms suggest that there's some leakage somewhere. I have to order some caps (I wish I had kept my parts bins when I moved!).

19809. Re: [DrakeRadio] transmitter section of TR3

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-05 13:50:00 UTC
From: Al Parker
Topic: 19804 Message: 19809

Good AM John,
Sorry I didn't get back to you earlier. I've just hunted down my TR-3 manual & info, that was one of the last things I've worked on here, but that was a cupla mo.s ago.
Looks like V-4, mixer, is only used for xmt, that might be a place to look. Look at pg 24 in the manual for a block diagram, and read the paragraph above that for some further thoughts. It might be possible that V4 cathode isn't getting grounded in xmt.
Somewhere I have a marked up block diagram that shows what freq.s should be seen at each point, but of course I can't find that now. V4 gets the IF in plus the output of V-1 mixer, to give the xmt freq.
Hope this helps a bit.

Date: 2014-04-05 14:04:56 UTC
From: Bill Jackson
Topic: 19806 Message: 19810

Vic,

It appears the seller does not know much about what he is selling. It looks to me like he did a copy and paste from another ad or one of his offerings, perhaps for an HT that would need a drop in charger to test.

Also, the age of this radio is more likely in the 1968-1969 range than 1976, based upon the partial serial number I see in one of his photos.

Overall, it looks well used, but restorable for sure. The average selling price for an R-4B according to the WB4HFN web site is $328.

See http://wb4hfn.com/DRAKE/DrakeSalePriceHistory.htm)

Good Luck!

73 de Bill, K9RZ

19811. AC-4 component value

Yahoo group: DrakeRadio (2014-01 — 2014-05)

From: Robert Logan
Topic: 19811 Message: 19811

Does anyone happen to know what the watt rating is for R6 in the AC-4? The pot sets the bias for the (in my case) T-4XC.

I've seen some rated at 5 watts, some at 2 watts, some even less in other circuits. Thanks for the help. Bob, NZ5A

John -

V4 is the likely culprit, it is the transmit mixer, and of course V6 is important! The PA set
to idle confirms ONLY the PA is working, and it should be 0.1A, NOT 50 mA. Having the idle set
to 50 mA would make the PA harder to drive, and needs to be corrected before you get too far
into the weeds!

The fact that the receiver works confirms that all the oscillators are working properly, and
eliminates about 80% of the circuitry in the radio.

Since you've swapped the tubes, including V4 and V5, I would suspect the keying of those stages. There is a 'XMIT CATH' that must be grounded by the relay to enable the transmitter.
Pin 7 of V4 and V15, along with Pin 1 of V6 should be ~ 2-3V in transmit. If they are 100+ V,
the relay or associated wiring is suspect.

If these voltages are correct, then you'll have to investigate the operation of V4 more closely. Start by checking the DC voltages from the chart in the manual. If you start on 80M,
you should have 9 MHz and 5 MHz at the Grid of V4, and 4 MHz on the Plate.

By this point you've probably found the problem. If not, report back with results of these tests.

My guess is they have no idea what they're talking about! They probably are looking at the ACCY
POWER jack on the back and are afraid to plug it in using the attached power cord!!. It's a version 2, and looks to be in decent shape. It's probably plug and play, but most anyone who
would want it will know that so it's probably going to bring a decent price.

Bob -

I think the original was probably a regular carbon pot, typically rated at 2W. It never sees
more than about 150 mW dissipation, but because of the catastrophic results of it's failure,
I'd prefer a wirewound, probably 4W. Not for the dissipation, but because carbon pots don't do
well with DC applied to them.

Don't bid at all, it only drives the price up! Wait for the last minute, fix your max bid and dump it within the last 10 seconds. No one will have a chance to up-bid you! It's called 'sniping.' My wife and I have been on eBay since it's inception in the 90's, we've countless items this way. Bidding early on and "bidding often" is ignorant and only drives the price up.

Good luck and lurk in the shadows, get it cheap and save your money.

I must concur. When I sell, bidding early, and often, IS what I want buyers to do. But, it's the last thing I want to do, as a buyer.
Bid early, and often, is the mantra, of eBay sellers! And, an enemy to buyers wallets.

And, if someone is looking for a B Line, or C Line, contact me off list, and we can discuss the possible impending sale of my two sets of Drake Twins.

Hi Dave,

Give me a day or two to check my inventory.

This is for the group as well...
I have acquired a dear friend of mine's estate. I have a huge lot of spare parts, a couple cabinets and 8 boxes full of repair parts and tubes. I also have several complete sets. Here are the sets that I currently have:

Drake ...
Qty 5 - TR-4 xcvr
Qty 4 - TR-4C xcvr
Qty 4 - TR-4Cw xcvr
Qty 4 - T-4XC xmtr
Qty 1 - R-4B rcvr
Qty 2 - R-4C rcvr with upgrades
Qty 1 - R-2C rcvr
Qty 1 - L-4B with P/S
Qty 2 - L-4B without P/S
Qty 2 - RV-4 remote VFO
Qty 2 - RV-4C remote VFO
Qty 4 - MS-4 speaker

Swan 700cx xcvr with P/S

National 109 rcvr and matching speaker

Heathkit DX-40 with matching VF-1 VFO

Heathkit DX-40

Lots of Sure desk mics.

I have cleaned and aligned a TR-4Cw with the matching speaker and power supply and sold it to a friend of mine at work. I'm a communications systems engineer for Motorola in Atlanta. I maintain the big public safety systems and 911 centers.

Anyhow, he is very pleased with the rig. These all look nearly new. Little or no signs of wear.

All I can tell you is that my friend and his father had these up in NY. I'm fairly sure they had an electronics business up there and probably sold Ham Radio gear.

I will be offering this equipment for sale, and spare / repair parts as well. I remember seeing like 20 new relays, a drawer full of the red front lamps and retaining clips, blue plexiglass, pots, filters, circuit boards, knobs, feet, upgrade kits, tons of stuff!

If anyone in the group is looking for specific items, let me know what you need and I'll see if I have it or not.

Thanks for having a look.

Hello
I am watching an R4B on Ebay (261442251035). The seller doesn't know if it works or otherwise because he hasn't got a charging power
station. I've never had a 4B so I don't know what he means by ' charging power station '. Can anybody put me wise, please?

Thank you, Gary, for usual sage advice. I'll chech at Fry's tomorrow but sounds like wire wound might be someone more like Mouser. Will report back source.

Thanks again, friend. Bob NZ5A

Actually, I've been successful as a buyer using both strategies.

The secret to not paying too much is to stick with your final offer and not get caught up.

I've had times when I've bid low but not too low, and have won a real bargain. That R-4 I had last year falls into this category. Got it, with the mint MS-4, for $100 plus about $25 shipping. The fuse was blown.

I also pick off items at the last minute. Won an R-4C for pretty cheap using that strategy. I look for the lousy marketing - the folks who can't adequately describe what they've got, but I can tell from the pics that the stuff has potential. Sometimes I score, big-time. Sometimes, I spend hours fixing something so that I can break even. Usually, I'm ahead. You need an "eye" and a sense of value.

Excellent point Steve, the stuff listed in odd places.

I was browsing Motorola commercial gear one day and found a set of movie prop swords from the Kill Bill movie with a certificate of authenticity and Uma Therman pictured with them. I got that set of 3 samurai swords, shipped, with the stand and certificate for $50. I don't collect stuff like that at all, but what the heck. Fake Hitori Hanzo swords that smell like Uma Therman.. I threw $50 at them ;)

19830. Drake Gear and Parts

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-06 04:36:14 UTC
From: David E. Rudd, CET WCM
Topic: 19830 Message: 19830

Greetings to everyone on the list.

I acquired an estate full of Drake gear and parts. Here is the list. If you need something in the R-4 or TR-4 series and it's not on here, please feel free to ask; I may be able to dig around and find it for you.

Qty 5 TR-4 xcvr
Qty 4 TR-4C xcvr
Qty 4 TR-4Cw xcvr
Qty 4 T-4XC xmtr
Qty 1 R-4B rcvr
Qty 2 R-4C rcvr with Sherwood Engineering competition upgrades
Qty 1 R-2C rcvr
Qty 2 L-4B amplifiers without P/S
Qty 2 RV-4 remote VFO
Qty 2 RV-4C remote VFO
Qty 4 MS-4 speaker / cabinet

1 Drake TR-4 for parts

Qty 8 relays R10-E1-Y4-V2.5K 48VDC
Qty 4 RIT plugs for TR4Cw
Qty 12 L7 lamps
Qty 2 .0007MFD 2500WVDC caps
Qty 12 Meter / Dial lamps
Qty 12 5 amp slo-blo power supply fuses
Qty 3 Resistors 2,200,000 ohm labeled "Drake 9MHz resistors"
Qty 2 35.500 MHz crystals
Qty 2 sheets of blue dial transparent plastic
Qty 3 sheets of white dial background plastic
Qty 4 relay retaining spring wires
Qty 12 noise blanker mounts for R4 rcvr a
Qty 9 red panel lamps "Drake -C2A" with retaining clips
Qty 12 fuse holders with caps
Qty 3 multi-value capacitor, 65-20-10/350 10/50
Qty 1 multi-value capacitor, 65/350 20/250 10/50
Various pots and switches
R4C to T4XC interconnect cables
Qty 12 Drake mic plugs
Qty 1 set Band Switch wafers for TR-4Cw
Qty 1 T4/T4X cox delay relay
Qty 1 T4/TR4 Speech Processor, DX Engineering LC-2-T4X
Qty 1 R4 Noise Blanker with cable
Qty 1 L4B filament transformer
Qty 1 TR4 series Plate Current meter
Qty 1 R4 series S-unit / DB meter

Qty 1 bezel T4/R4 meter
Qty 2 TR-4 series Plate/Current meter
Qty 5 Drake tuning dial inlays
Qty 3 T4/T4X carrier balance pots
Qty 12 TR4 series antenna fuse lamps
Qty 1 R4C RCC4 Calibrator PCB
Qty 1 R4C DC Pwr Supply PCB
Qty 1 Drake 34-PNB plug in Noise Blanker with install instructions
Various knobs, inlays and calibration skirts
Qty 1 plug in 9vdc @ 200 am transformer
Various plug in crystals
Qty 4 resistors, wire wound, 5K @ 25 watts, tubular 2"
Qty 10 560MFD @ 400 vdc electrolytic capacitors
Qty 50 47 ohm carbon resistors, TR4 series parasitic suppressor
Qty 14 spring clips for the final tube top anode
Qty 3 Jones connectors, 12 pin AC-4 power supply to rig
Qty 9 20K potentiometer
Qty 24 diodes 1N5408 for L4B
Qty 1 RY1 antenna relay for L4B
Qty 1 AGC pot for L4B
Qty 2 sets C43 & 44 door knob caps for L4B
Qty 2 fox sockets for L4B
Qty 3 mica insulators for L4B
Qty 1 set (2 sockets) for L4B / 3-500Z's
Qty 1 RF Plate Choke for L4B (RFC-4)
Qty 2 Parasitic choke assemblies L4B
Sherwood Engineering Kits, complete mods for R-4C, competition grade:
PD-4 (R4-C Product Detector)
MIX-4C (mixer for R-4C)
AMP-4 (R-4C audio amp)
PS-4 (R-4C power supply replacement)
Note: I found the credit card receipt in with the box of Sherwood Engineering kits, they spent over $900 on these kits to max out the performance of these receivers.
Sure desk mics
Astatic desk mics
Lots of tubes.
Various other spare parts, bits, bunches, boards and related stuff.

I don't have prices listed because I haven't had the time nor motivation to research all of this. If you are interested in something, let me know, make a reasonable offer and I'll check the values at eBay, WB4HFN, and other sources.

I appreciate serious, reasonable offers.
Ridiculous low offers will be scorned and deleted, please don't waste my time.

Thanks for your interest and I hope I have something here that can help you out.

Are there any dedicated repair guys out there that want the entire lot? I am willing to make a deal on everything here. I will also post photos if anyone is interested.

Thanks for looking.

David,
EBAY prices are inflated over standard hamfest prices and one has shipping to pay also. At least 30% sometimes 50% higher on EBAY!
Go into EBAY's history of sales for a particular item, make a list and average them, then take 25% off and you should be aball-park. Just saying...

Subject: [DrakeRadio] Drake Gear and Parts

Greetings to everyone on the list.

I acquired an estate full of Drake gear and parts. Here is the list. If you need something in the R-4 or TR-4 series and it's not on here, please feel free to ask; I may be able to dig around and find it for you.

Qty 5 TR-4 xcvr
Qty 4 TR-4C xcvr
Qty 4 TR-4Cw xcvr
Qty 4 T-4XC xmtr
Qty 1 R-4B rcvr
Qty 2 R-4C rcvr with Sherwood Engineering competition upgrades
Qty 1 R-2C rcvr
Qty 2 L-4B amplifiers without P/S
Qty 2 RV-4 remote VFO
Qty 2 RV-4C remote VFO
Qty 4 MS-4 speaker / cabinet

1 Drake TR-4 for parts

Qty 8 relays R10-E1-Y4-V2.5K 48VDC
Qty 4 RIT plugs for TR4Cw
Qty 12 L7 lamps
Qty 2 .0007MFD 2500WVDC caps
Qty 12 Meter / Dial lamps
Qty 12 5 amp slo-blo power supply fuses
Qty 3 Resistors 2,200,000 ohm labeled "Drake 9MHz resistors"
Qty 2 35.500 MHz crystals
Qty 2 sheets of blue dial transparent plastic
Qty 3 sheets of white dial background plastic
Qty 4 relay retaining spring wires
Qty 12 noise blanker mounts for R4 rcvr a

Qty 9 red panel lamps "Drake -C2A" with retaining clips
Qty 12 fuse holders with caps
Qty 3 multi-value capacitor, 65-20-10/350 10/50
Qty 1 multi-value capacitor, 65/350 20/250 10/50
Various pots and switches
R4C to T4XC interconnect cables
Qty 12 Drake mic plugs
Qty 1 set Band Switch wafers for TR-4Cw
Qty 1 T4/T4X cox delay relay
Qty 1 T4/TR4 Speech Processor, DX Engineering LC-2-T4X
Qty 1 R4 Noise Blanker with cable
Qty 1 L4B filament transformer
Qty 1 TR4 series Plate Current meter
Qty 1 R4 series S-unit / DB meter
Qty 1 bezel T4/R4 meter
Qty 2 TR-4 series Plate/Current meter
Qty 5 Drake tuning dial inlays
Qty 3 T4/T4X carrier balance pots
Qty 12 TR4 series antenna fuse lamps
Qty 1 R4C RCC4 Calibrator PCB
Qty 1 R4C DC Pwr Supply PCB
Qty 1 Drake 34-PNB plug in Noise Blanker with install instructions
Various knobs, inlays and calibration skirts
Qty 1 plug in 9vdc @ 200 am transformer
Various plug in crystals
Qty 4 resistors, wire wound, 5K @ 25 watts, tubular 2"
Qty 10 560MFD @ 400 vdc electrolytic capacitors
Qty 50 47 ohm carbon resistors, TR4 series parasitic suppressor
Qty 14 spring clips for the final tube top anode
Qty 3 Jones connectors, 12 pin AC-4 power supply to rig
Qty 9 20K potentiometer
Qty 24 diodes 1N5408 for L4B
Qty 1 RY1 antenna relay for L4B
Qty 1 AGC pot for L4B
Qty 2 sets C43 & 44 door knob caps for L4B
Qty 2 fox sockets for L4B
Qty 3 mica insulators for L4B
Qty 1 set (2 sockets) for L4B / 3-500Z's
Qty 1 RF Plate Choke for L4B (RFC-4)
Qty 2 Parasitic choke assemblies L4B
Sherwood Engineering Kits, complete mods for R-4C, competition grade:
PD-4 (R4-C Product Detector)
MIX-4C (mixer for R-4C)
AMP-4 (R-4C audio amp)
PS-4 (R-4C power supply replacement)
Note: I found the credit card receipt in with the box of Sherwood Engineering kits, they spent over $900 on these kits to max out the performance of these receivers.
Sure desk mics
Astatic desk mics
Lots of tubes.

Various other spare parts, bits, bunches, boards and related stuff.

19842. R4B

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-06 15:54:00 UTC
From: g4jss@tiscali.co.uk
Topic: 5130 Message: 19842

Hello all
Thanks for input re this. The general opinion seems to be that the seller does not appear to have any knowledge of what he is selling. A
strong possibility is that he has plugged it in,it lit up and got no noise (assuming that he attached a speaker) and decided to sell it
as non working. If the R4B is the same as the R4C then he may have not shorted the muting jack on the back panel hence silence.

Just a thought.

Thank you.

Vic

Thanks for input re this. The general opinion seems to be that the seller does not appear to have any knowledge of what he is selling. Just a thought. Vic G4JSS
Vic, based on the one sentence above in re your thoughts things are possible, including a real inop. Carl WD8NHK

Hi Bernie
I'd sure like to know where these hamfests are located. The ones I'm always hearing about where prices are unbelievably low.
Of the fests I have attended in the past several years the prices are right even with ebay as the sellers have come to use that as a blue book for prices. Realistically the price at a hamfest should be lower because the seller doesn't have to pack and ship the item and doesn't pay a fee off the top. To me those two items are worth a lot.
And, as a buyer I feel I am already paying by the very cost of being present. Time away from work, fuel costs, and in my case motel and meals because any reasonable sized fest involves more than local travel.

I like EBAY because I know that on my trip there I will find what I'm looking for at a price I am willing to pay. There is no cost to me if I don't find it this trip. And, in spite of the urban legend horror stories I have had very few unpleasant buying experiences and have found that PayPal is number one a buyers advocate. One time I won a nice MFJ analyzer at a reasonable price because the seller did not have an established history and very few bid. After several weeks of "the dog ate my homework I am sick with a horrible disease" stories about why I didn't receive my purchase because it hadn't been shipped I asked for a refund and also told my story to PayPal. I received a full refund from the "seller" AND an apology email from PayPal with a coupon in the amount of $250.00 spend anyway I wanted on Ebay. That's right! Believe it or not.

True, there are always auctions that go too high because two fools get into a contest following the bid early bid often mentality. Nothing that can be done about it except wait for the next time. I do sometimes bid a low amount early so I get email reminders about the item I am watching. I really tics me when I actually forget to go back at the end and snipe something---which is the ONLY way to win BTW.

So, long story short, I have obtained many items of value to me at very good prices based on using my eyes and gut to analyze the photos, asking a question, reading the ad copy. I DO NOT buy from people that can't even write simple text and have numerous grammar and spelling errors. Nor do I buy from those who profane me for my questions and comments. I do report them for whatever good that does.
I do snipe and I seldom inform others about a good deal I'm watching unless it is something I'm really not interested in.

My 5c worth (inflation you know)

David,
EBAY prices are inflated over standard hamfest prices and one has shipping to pay also. At

least 30% sometimes 50% higher on EBAY!
Go into EBAY's history of sales for a particular item, make a list and average them, then take 25% off and you should be aball-park. Just saying...

Subject: [DrakeRadio] Drake Gear and Parts

Greetings to everyone on the list.

I acquired an estate full of Drake gear and parts. Here is the list. If you need something in the R-4 or TR-4 series and it's not on here, please feel free to ask; I may be able to dig around and find it for you.

Qty 5 TR-4 xcvr
Qty 4 TR-4C xcvr
Qty 4 TR-4Cw xcvr
Qty 4 T-4XC xmtr
Qty 1 R-4B rcvr
Qty 2 R-4C rcvr with Sherwood Engineering competition upgrades
Qty 1 R-2C rcvr
Qty 2 L-4B amplifiers without P/S
Qty 2 RV-4 remote VFO
Qty 2 RV-4C remote VFO
Qty 4 MS-4 speaker / cabinet

1 Drake TR-4 for parts

Qty 8 relays R10-E1-Y4-V2.5K 48VDC
Qty 4 RIT plugs for TR4Cw
Qty 12 L7 lamps
Qty 2 .0007MFD 2500WVDC caps
Qty 12 Meter / Dial lamps
Qty 12 5 amp slo-blo power supply fuses
Qty 3 Resistors 2,200,000 ohm labeled "Drake 9MHz resistors"
Qty 2 35.500 MHz crystals
Qty 2 sheets of blue dial transparent plastic
Qty 3 sheets of white dial background plastic
Qty 4 relay retaining spring wires
Qty 12 noise blanker mounts for R4 rcvr a
Qty 9 red panel lamps "Drake -C2A" with retaining clips
Qty 12 fuse holders with caps
Qty 3 multi-value capacitor, 65-20-10/350 10/50
Qty 1 multi-value capacitor, 65/350 20/250 10/50
Various pots and switches
R4C to T4XC interconnect cables
Qty 12 Drake mic plugs
Qty 1 set Band Switch wafers for TR-4Cw

Qty 1 T4/T4X cox delay relay
Qty 1 T4/TR4 Speech Processor, DX Engineering LC-2-T4X
Qty 1 R4 Noise Blanker with cable
Qty 1 L4B filament transformer
Qty 1 TR4 series Plate Current meter
Qty 1 R4 series S-unit / DB meter
Qty 1 bezel T4/R4 meter
Qty 2 TR-4 series Plate/Current meter
Qty 5 Drake tuning dial inlays
Qty 3 T4/T4X carrier balance pots
Qty 12 TR4 series antenna fuse lamps
Qty 1 R4C RCC4 Calibrator PCB
Qty 1 R4C DC Pwr Supply PCB
Qty 1 Drake 34-PNB plug in Noise Blanker with install instructions
Various knobs, inlays and calibration skirts
Qty 1 plug in 9vdc @ 200 am transformer
Various plug in crystals
Qty 4 resistors, wire wound, 5K @ 25 watts, tubular 2"
Qty 10 560MFD @ 400 vdc electrolytic capacitors
Qty 50 47 ohm carbon resistors, TR4 series parasitic suppressor
Qty 14 spring clips for the final tube top anode
Qty 3 Jones connectors, 12 pin AC-4 power supply to rig
Qty 9 20K potentiometer
Qty 24 diodes 1N5408 for L4B
Qty 1 RY1 antenna relay for L4B
Qty 1 AGC pot for L4B
Qty 2 sets C43 & 44 door knob caps for L4B
Qty 2 fox sockets for L4B
Qty 3 mica insulators for L4B
Qty 1 set (2 sockets) for L4B / 3-500Z's
Qty 1 RF Plate Choke for L4B (RFC-4)
Qty 2 Parasitic choke assemblies L4B
Sherwood Engineering Kits, complete mods for R-4C, competition grade:
PD-4 (R4-C Product Detector)
MIX-4C (mixer for R-4C)
AMP-4 (R-4C audio amp)
PS-4 (R-4C power supply replacement)
Note: I found the credit card receipt in with the box of Sherwood Engineering kits, they spent over $900 on these kits to max out the performance of these receivers.
Sure desk mics
Astatic desk mics
Lots of tubes.
Various other spare parts, bits, bunches, boards and related stuff.

I don't have prices listed because I haven't had the time nor motivation to research all of this. If you are interested in something, let me know, make a reasonable offer and I'll check the values at eBay, WB4HFN, and other sources.

I appreciate serious, reasonable offers.
Ridiculous low offers will be scorned and deleted, please don't waste my time.

Thanks for your interest and I hope I have something here that can help you out.

Are there any dedicated repair guys out there that want the entire lot? I am willing to make a deal on everything here. I will also post photos if anyone is interested.

Thanks for looking.

Paul,

Thanks for that input. I did what Bernie suggested and the prices just seemed way too low. Funny he did that to me because he didn't even want anything on my list.

I'm the new guy to the group, and have to get used to people. I was hoping not to get used by fellow hams tho. Good thing is, I don't 'have' to sell any of this. It's been happily setting on covered shelves in my climate controlled basement. I play with a rig or two when I choose. I put the list up, hoping to help the guys out that have been looking for things. And for all of you that have responded, thank you. I'm getting to your emails in the order I've received them.

Paul,

The only hamfests I've attended are all in North Dakota...International Peace Garden Hamfest on the border of US & Canada, the Bismarck (state capital)hamfest which draws from South Dakota, The Fargo area hamfest, which draws from Minnesota, and a hamfest (small one) at Garrison and one in Dickinson. Judging from the Drake 2-B with 2-BQ speaker I purchased from a 2nd party, as well as an R-390-A in excellent condition, again purchased from a 2nd party, and an Icom-706-MK-II-G from yet a different party, I saved anywhere from $200.00 to $500.00 based on comparable product on EBAY. No bidding wars...no need for Paypal,(fees)or EBAY (fees), no cost of shipping...no risk of Fed Ex or UPS using it for a football or target practice. Keep in mind this is just MY opinion...no offense was intended in any manner shape or form. My hamshack is too full now, with no room for a VIKING-II...so I cannot purchase anything further be it Drake or whatever.
But I thank you for the listing of the equipment available.

David,
I don't often post to the list, but I might make a couple of observations to use as you choose. If you don't need or even want to sell these at this time particularly, you might find it better to offer these parts (most especially the larger, harder to find items) as folks are looking for them to do repairs on this list. I bought what some would consider to be several parts as Drake sold out years ago to keep my gear in order as it gets older, and I have offered "spares" when folks ask for things I have extras of over the years and will continue to do it as I can. It helps keep these old Drakes perculating into the new century.

These proprietary parts are getting harder and harder to locate, and some of the ones you listed are definitely in that category. They aren't really needed until your L4B, etc breaks. THEN, they become valuable, not just spare parts, and the owner makes fair offers. Does that make sense??

The above is just offered as information, David, to a new member. One would have thought many of us were hoarding parts when we ordered our parts from Drake when they offered their "final sellout" in the 90's, but these stashes have kept many old rigs from either the junk pile or the hands of the ones who part them out on Ebay and other places. Personally I'd much rather hear them on the air as I did that nice C Line on 80M last night while tuning around with my old 75A4 Collins receiver. Just my opinion though and not worth much.
73 and good luck with your Drakes, David,
Don, WB5HAK

From: John King
Topic: 19804 Message: 19848

Garey, Thanks for the information. I now have carrier from the TR3. Was a switch problem. I haven't increased the idling current by changing the bias because, due to recent surgery, I cannot get to the bias control on supply which is on a higher shelf.
I can hear carrier on an adjacent receiver now when I initiate the push to talk. The VOX is not working but the PTT is working. I have changed the 12AX7 mike preamp but have not changed the 6EV7 because I haven't located one. I can't hear audio from the microphone in the adjacent receiver, so the speech from the microphone is not going through. Seems to correlate with the non working VOX. But I do get a carrier our from the low stages of the TR3 that i can hear in the adjacent receiver, but no speech from the microphone. Sounds like progress to me. 73, John K5PGW

It was just the irony of the message that struck me as humorous. Apologies as I didn't mean to offend.

From: Charles Ahlgren
Topic: 19830 Message: 19851

Do you have photos of the RV4C's?

I would be interested in a mint or near mint condx one to go along with my T4XCwrit.

19852. Re: [DrakeRadio] transmitter section of TR3

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-06 17:46:21 UTC
From: Garey Barrell
Topic: 19804 Message: 19852

John -

OK. We'll take progress! V18 is the MIC AMP, is that the one you swapped out?

What happens if you switch to X-CW with the SIDEBAND switch in X? Increasing the XMTR GAIN and
peaking RF TUNE should result in an increase in PLATE current. If it does, be sure and dip the
PLATE control quickly.

If the PTT is working, then the 6EV7 is probably ok. Be sure the VOX GAIN is advanced, and the
ANTI-VOX is at minimum.

What test equipment do you have??

73, Garey - K4OAH

John King wrote:
> Garey, Thanks for the information. I now have carrier from the TR3. Was a switch problem. I haven't increased the idling current by changing the bias because, due to recent surgery, I cannot get to the bias control on supply which is on a higher shelf.
> I can hear carrier on an adjacent receiver now when I initiate the push to talk. The VOX is not working but the PTT is working. I have changed the 12AX7 mike preamp but have not changed the 6EV7 because I haven't located one. I can't hear audio from the microphone in the adjacent receiver, so the speech from the microphone is not going through. Seems to correlate with the non working VOX. But I do get a carrier our from the low stages of the TR3 that i can hear in the adjacent receiver, but no speech from the microphone. Sounds like progress to me. 73, John K5PGW

David,
Bernie is a real straight shooter, and what he said is generally true. But not always. That's the problem with "general rule". It's not always going to be accurate, but will be, within the laws of average.
That said, Paul and Don, are also giving good advice, that really isn't all that contrary to what Bernie had to say. It's much a matter of perspective. If you enjoy going to hamfests, and socializing, hoping to run across something that maybe you want, and get it at a great deal. It's more pleasure, than business. But, if you need something, and take the time to go out of your way, to go to a Hamfest, and it costs you that which you otherwise would not have expended, then hamfests might not be the best way to go. eBay is convenient, and you pay for that convenience, in one way shape or form. Depending on your perspective, again.
eBay has it's cycles, to deal with, too. There are periods where the prices buyers are willing to pay, are amazingly elevated. Then there are times, where things are fairly reasonably representative of the market. RARELY, there are some good deals, to be found, there. It is "Free market economics, 101". Supply and demand, drive the prices.
If you flood the market with a truckload of similar equipment, all at once, you are only cheating yourself out of maximum value. Then again, if you are a purist, and simply want REASONABLE maximum value, and to ensure that which you are selling will go to the hands of someone who truly wants THAT piece of equipment, and will properly care for it, then, a place like this, dedicated to those who truly admire that particular item, is your best place. There a lot of butchers on eBay, who will happily disassemble a perfectly good, classic, in order to maximize their profit.
I haven't seen those "representative of the market" times in a while, but, I have been pretty inactive from eBay, for more than a year. I've maybe looked at ten things in the last 18 months. So, I couldn't begin to describe the current market conditions. However, much of that over pricing, is driven by that sense of competition, between bidders, and a "I'll win this at any cost" attitude.
But, Bernie's formula is a good general rule, for pricing. Simply because there are lots of eager buyers out there, who are willing to win, regardless of cost. When you can get a worldwide market, competing for the item you are selling, especially when the item is in relative low supply, the price goes up. Sometimes, exponentially.
I understand that you don't want to be taken advantage of. You certainly want to maximize your fair value, for what is being sold. eBay has it's upsides and it's downsides. We've all heard horror stories, and we've all heard about great things, happening there.
Again, using the "General Rule", folks here, in this group, will give their best advice, based on the facts they know, and how they personally interpret those facts. I've not known of an instance, where there was a voice here, in this group, truly leading someone down a rosy path to destruction. How you wish to take the information you have at your disposal, and utilize it, in your given situation, is your decision to make alone. But, there is one thing you can be assured of. If folks don't like the price you ask, one of a very few things will happen. Either it will not sell, or potential buyers will try to haggle you down (that's where knowing the market for your particular item helps a bunch), or you will get petty commentary, that does nothing to help, like criticism of your price, without an offer, to buy, at the price that individual believes is reasonable.

Personally, I trust and respect the advice of all three of these men. But, in this instance, and from my perspective, Don seems to have given the best advice. If you don't NEED to sell it, and can sit on it, as a slowly returning investment, you not only are doing a service for the Drake preservationist community, but you are also maximizing your investment return, because the value will only go up, on ALL of your listed items, over the coming months and years. Thanks to the butchers out there, the supply of good working Drake Radios, is only decreasing, therefore increasing the demand, and driving the prices upwards.

>> Greetings to everyone on the list.
>>
>> I acquired an estate full of Drake gear and parts. Here is the list. If you need something in the R-4 or TR-4 series and it's not on here, please feel free to ask; I may be able to dig around and find it for you.

>>
>> Qty 5 TR-4 xcvr
>> Qty 4 TR-4C xcvr
>> Qty 4 TR-4Cw xcvr
>> Qty 4 T-4XC xmtr
>> Qty 1 R-4B rcvr
>> Qty 2 R-4C rcvr with Sherwood Engineering competition upgrades
>> Qty 1 R-2C rcvr
>> Qty 2 L-4B amplifiers without P/S
>> Qty 2 RV-4 remote VFO
>> Qty 2 RV-4C remote VFO
>> Qty 4 MS-4 speaker / cabinet
>>
>> 1 Drake TR-4 for parts
>>
>> Qty 8 relays R10-E1-Y4-V2.5K 48VDC
>> Qty 4 RIT plugs for TR4Cw
>> Qty 12 L7 lamps
>> Qty 2 .0007MFD 2500WVDC caps
>> Qty 12 Meter / Dial lamps
>> Qty 12 5 amp slo-blo power supply fuses
>> Qty 3 Resistors 2,200,000 ohm labeled "Drake 9MHz resistors"
>> Qty 2 35.500 MHz crystals
>> Qty 2 sheets of blue dial transparent plastic
>> Qty 3 sheets of white dial background plastic
>> Qty 4 relay retaining spring wires
>> Qty 12 noise blanker mounts for R4 rcvr a
>> Qty 9 red panel lamps "Drake -C2A" with retaining clips
>> Qty 12 fuse holders with caps
>> Qty 3 multi-value capacitor, 65-20-10/350 10/50
>> Qty 1 multi-value capacitor, 65/350 20/250 10/50
>> Various pots and switches
>> R4C to T4XC interconnect cables
>> Qty 12 Drake mic plugs
>> Qty 1 set Band Switch wafers for TR-4Cw
>> Qty 1 T4/T4X cox delay relay
>> Qty 1 T4/TR4 Speech Processor, DX Engineering LC-2-T4X
>> Qty 1 R4 Noise Blanker with cable
>> Qty 1 L4B filament transformer
>> Qty 1 TR4 series Plate Current meter
>> Qty 1 R4 series S-unit / DB meter
>> Qty 1 bezel T4/R4 meter
>> Qty 2 TR-4 series Plate/Current meter
>> Qty 5 Drake tuning dial inlays
>> Qty 3 T4/T4X carrier balance pots
>> Qty 12 TR4 series antenna fuse lamps
>> Qty 1 R4C RCC4 Calibrator PCB
>> Qty 1 R4C DC Pwr Supply PCB
>> Qty 1 Drake 34-PNB plug in Noise Blanker with install instructions
>> Various knobs, inlays and calibration skirts

>> Qty 1 plug in 9vdc @ 200 am transformer
>> Various plug in crystals
>> Qty 4 resistors, wire wound, 5K @ 25 watts, tubular 2"
>> Qty 10 560MFD @ 400 vdc electrolytic capacitors
>> Qty 50 47 ohm carbon resistors, TR4 series parasitic suppressor
>> Qty 14 spring clips for the final tube top anode
>> Qty 3 Jones connectors, 12 pin AC-4 power supply to rig
>> Qty 9 20K potentiometer
>> Qty 24 diodes 1N5408 for L4B
>> Qty 1 RY1 antenna relay for L4B
>> Qty 1 AGC pot for L4B
>> Qty 2 sets C43 & 44 door knob caps for L4B
>> Qty 2 fox sockets for L4B
>> Qty 3 mica insulators for L4B
>> Qty 1 set (2 sockets) for L4B / 3-500Z's
>> Qty 1 RF Plate Choke for L4B (RFC-4)
>> Qty 2 Parasitic choke assemblies L4B
>> Sherwood Engineering Kits, complete mods for R-4C, competition grade:
>> PD-4 (R4-C Product Detector)
>> MIX-4C (mixer for R-4C)
>> AMP-4 (R-4C audio amp)
>> PS-4 (R-4C power supply replacement)
>> Note: I found the credit card receipt in with the box of Sherwood Engineering kits, they spent over $900 on these kits to max out the performance of these receivers.
>> Sure desk mics
>> Astatic desk mics
>> Lots of tubes.
>> Various other spare parts, bits, bunches, boards and related stuff.
>>
>> I don't have prices listed because I haven't had the time nor motivation to research all of this. If you are interested in something, let me know, make a reasonable offer and I'll check the values at eBay, WB4HFN, and other sources.
>>
>> I appreciate serious, reasonable offers.
>> Ridiculous low offers will be scorned and deleted, please don't waste my time.
>>
>> Thanks for your interest and I hope I have something here that can help you out.
>>
>> Are there any dedicated repair guys out there that want the entire lot? I am willing to make a deal on everything here. I will also post photos if anyone is interested.
>>
>> Thanks for looking.

19854. Re: [DrakeRadio] Drake Gear and Parts

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-06 18:21:59 UTC
From: <w7pva@...>
Topic: 19830 Message: 19854

Yesterday I searched eBay, as is my practice, just cruising looking for interesting items at a reasonable price. I found a R4C, T4C and a MS4 with PS. The seller had separated the set and was offering each for $199. In the text he stated that he had no knowledge of how they worked, if they worked. He only knew that when they were connected that the tubes and lights lit.
I have seen a set of twins go for as little as $250 from a private party AND they operated as they should. The seller on eBay is offering a pig-in-a-poke for a price reserved, or should be, for operating equipment. eBay is caveat emptor...
David, I wish you well in the sale of your equipment. I always like to deal with another ham, if the price is reasonable, a win-win, for both sides. I've found that most hams are honest about the gear they sell. Some do not always tell the whole story. For the most part items I have purchased from fellow hams were as advertised but generally in need of a little TLC and minor repairs.

Good Luck and 73,

Bill - W7PVA

Paul,

Thanks for that input. I did what Bernie suggested and the prices just seemed way too low. Funny he did that to me because he didn't even want anything on my list.

I'm the new guy to the group, and have to get used to people. I was hoping not to get used by fellow hams tho. Good thing is, I don't 'have' to sell any of this. It's been happily setting on covered shelves in my climate controlled basement. I play with a rig or two when I choose. I put the list up, hoping to help the guys out that have been looking for things. And for all of you that have responded, thank you. I'm getting to your emails in the order I've received them.

Hi Dan,

Thanks for that, I appreciate it. I also value the advice from everyone, I understand the folks here have been trying to help, I appreciate that too. I've gone thru boxes and have been picking parts for those that have asked. I'm not about making a big profit on any of this stuff. Breaking even is fine with me. I'm retired from the US Army and I work for Motorola on commercial and public safety communications systems, so I don't have to sell this stuff to eat. If I can help you folks out, that works for me.

David

>
> David,
> Bernie is a real straight shooter, and what he said is generally true. But not always. That's the problem with "general rule". It's not always going to be accurate, but will be, within the laws of average.
> That said, Paul and Don, are also giving good advice, that really isn't all that contrary to what Bernie had to say. It's much a matter of perspective. If you enjoy going to hamfests, and socializing, hoping to run across something that maybe you want, and get it at a great deal. It's more pleasure, than business. But, if you need something, and take the time to go out of your way, to go to a Hamfest, and it costs you that which you otherwise would not have expended, then hamfests might not be the best way to go. eBay is convenient, and you pay for that convenience, in one way shape or form. Depending on your perspective, again.
> eBay has it's cycles, to deal with, too. There are periods where the prices buyers are willing to pay, are amazingly elevated. Then there are times, where things are fairly reasonably representative of the market. RARELY, there are some good deals, to be found, there. It is "Free market economics, 101". Supply and demand, drive the prices.
> If you flood the market with a truckload of similar equipment, all at once, you are only cheating yourself out of maximum value. Then again, if you are a purist, and simply want REASONABLE maximum value, and to ensure that which you are selling will go to the hands of someone who truly wants THAT piece of equipment, and will properly care for it, then, a place like this, dedicated to those who truly admire that particular item, is your best place. There a lot of butchers on eBay, who will happily disassemble a perfectly good, classic, in order to maximize their profit.
> I haven't seen those "representative of the market" times in a while, but, I have been pretty inactive from eBay, for more than a year. I've maybe looked at ten things in the last 18 months. So, I couldn't begin to describe the current market conditions. However, much of that over pricing, is driven by that sense of competition, between bidders, and a "I'll win this at any cost" attitude.
> But, Bernie's formula is a good general rule, for pricing. Simply because there are lots of eager buyers out there, who are willing to win, regardless of cost. When you can get a worldwide market, competing for the item you are selling, especially when the item is in

relative low supply, the price goes up. Sometimes, exponentially.
> I understand that you don't want to be taken advantage of. You certainly want to maximize your fair value, for what is being sold. eBay has it's upsides and it's downsides. We've all heard horror stories, and we've all heard about great things, happening there.
> Again, using the "General Rule", folks here, in this group, will give their best advice, based on the facts they know, and how they personally interpret those facts. I've not known of an instance, where there was a voice here, in this group, truly leading someone down a rosy path to destruction. How you wish to take the information you have at your disposal, and utilize it, in your given situation, is your decision to make alone. But, there is one thing you can be assured of. If folks don't like the price you ask, one of a very few things will happen. Either it will not sell, or potential buyers will try to haggle you down (that's where knowing the market for your particular item helps a bunch), or you will get petty commentary, that does nothing to help, like criticism of your price, without an offer, to buy, at the price that individual believes is reasonable.
> Personally, I trust and respect the advice of all three of these men. But, in this instance, and from my perspective, Don seems to have given the best advice. If you don't NEED to sell it, and can sit on it, as a slowly returning investment, you not only are doing a service for the Drake preservationist community, but you are also maximizing your investment return, because the value will only go up, on ALL of your listed items, over the coming months and years. Thanks to the butchers out there, the supply of good working Drake Radios, is only decreasing, therefore increasing the demand, and driving the prices upwards.

> >> Of the fests I have attended in the past several years the prices are right even with ebay as the sellers have come to use that as a blue book for prices. Realistically the price at a hamfest should be lower because the seller doesn't have to pack and ship the item and doesn't pay a fee off the top. To me those two items are worth a lot.
> >> And, as a buyer I feel I am already paying by the very cost of being present. Time away from work, fuel costs, and in my case motel and meals because any reasonable sized fest involves more than local travel.
> >>
> >> I like EBAY because I know that on my trip there I will find what I'm looking for at a price I am willing to pay. There is no cost to me if I don't find it this trip. And, in spite of the urban legend horror stories I have had very few unpleasant buying experiences and have found that PayPal is number one a buyers advocate. One time I won a nice MFJ analyzer at a reasonable price because the seller did not have an established history and very few bid. After several weeks of "the dog ate my homework I am sick with a horrible disease" stories about why I didn't receive my purchase because it hadn't been shipped I asked for a refund and also told my story to PayPal. I received a full refund from the "seller" AND an apology email from PayPal with a coupon in the amount of $250.00 spend anyway I wanted on Ebay. That's right! Believe it or not.
> >>
> >> True, there are always auctions that go too high because two fools get into a contest following the bid early bid often mentality. Nothing that can be done about it except wait for the next time. I do sometimes bid a low amount early so I get email reminders about the item I am watching. I really tics me when I actually forget to go back at the end and snipe something---which is the ONLY way to win BTW.
> >>
> >> So, long story short, I have obtained many items of value to me at very good prices based on using my eyes and gut to analyze the photos, asking a question, reading the ad copy. I DO NOT buy from people that can't even write simple text and have numerous grammar and spelling errors. Nor do I buy from those who profane me for my questions and comments. I do report them for whatever good that does.

That was going to be my guess. Most email clients put them on as attachments, and Yahoo strips those out. Interesting.

Will have to use "copy/paste" into the body next time I'm needing to do this.

Subject: [DrakeRadio] R4B

Hello all
Thanks for input re this. The general opinion seems to be that the seller does not appear to have any knowledge of what he is selling. A
strong possibility is that he has plugged it in,it lit up and got no noise (assuming that he attached a speaker) and decided to sell it
as non working. If the R4B is the same as the R4C then he may have not shorted the muting jack on the back panel hence silence.

Just a thought.

Thank you.

19858. R4B Alignment Observations

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-06 21:05:25 UTC
From: GRANT YOUNGMAN
Topic: 19804 Message: 19858

I posted earlier about the notch alignment on my R4B being off a bit. I've since redone the complete IF alignment of the radio again, which didn't fix the notch issue – it really does appear to be out some. It will sweep the notch through the LSB completely, but will only go about 1.5 Khz into the USB passband. I'm more in the mood to leave it as is, since life is short, and I need to get on to other projects – like refinishing the cabinet.

I put a sweep generator on the IF and looked at the passband. What I discovered is that if I aligned the passband tuner (PBT) per the manual instructions I invariably ended up with a ragged and non-symetrical passband in the 1.4 and 2.8 Khz positions. This likely explains why one sideband (usually the USB side) sounded a bit "muffled" compared to the LSB side. I finally did the PBT alignment in the 2.8 Khz bandwidth position with a sweep generator to get the most flat and symmetrical IF response I could. The passband shape in the 400 Hz and 1.4 Khz positions looks quite good also.

AND – the radio sounds excellent now on both LSB and USB. Sweep alignment turned out to be admittedly more tedious than I'd hoped, but IMO it is well worth the effort if you have the equipment to do it. Maybe what this really means is that if you don't think the PBT is messed up in one of these R4x radios, leave it alone! :)

Just posted a couple of photos of my first EVER Drake station, taken TODAY!! My R4A is working fine, as is the T4XC with new rebuilt AC4 power supply (not in photo). I have made quite a few QSOs, life is good!! Now to get an MS4 ... ...

(oh yeah, and to align the radios too, but for now working just fine!!!)

Oh yeah, the blue main dials are from LEDs I got from 2BRADIOPARTS. I still need to remove the blue backing on the T4X. I don't know WHY the S meter on the R4A is WHITE but the PLATE AMPS meter on the T4XC has the nice Drake "blue" (I guess this is the REAL "blue" that I should be shooting for, not the ultra-blue from the LED).
Looks awesome to ME.

Paul,

Welcome to the group.

I have never been a big fan of the blue LED implementation in the Drake line but yours looks quite nice. Now if you can get your meters to match you will have it licked.

Very nice,

Doug - N9XTF

Did you send photos to the list, if so they were
stripped off by the list machine. Post them somewhere and
send a link to the list.
I don't know how the R4A meter is set up but in the R4B
and T4XB there is a strip of filter material runing around
the edge of the meter where the lamp is. This serves to
color the light from the lamp.
The idea of the arrangement is that the red markings on
dial and meter will be illuminated by ambient light while
the filter makes the inside light blue. The correct filter
is Lee Lagoon Blue. The original color was a sort of
greenish blue. To my eye very similar to the color of the
phosphor type p-3 used on late CRTs and tuning indicators.
At the time the Drake line was being made many consumer
electronics (mostly hi-fi stuff) had a sort of radio-active
blue glow.

I have seen this many times from both Ebay sellers and other sites. Guys will post their adds, utilizing very poor grammar and language in an attempt to look very uneducated on the Ham Radio subject. Under further investigation, I have found that this is done on purpose in a great deal of cases. This gets the items sold and the seller hopes to not have blowback when the item shows up in a less than desirable manner. A great deal of the sellers are actually Ham Radio operators that do or should know more about the equipment they are selling.

There appears to be a plethora of "Estate Sale" items that show up on Ebay. Good lord, are all of the Ham Radio operators croaking off at the same time? I think not!!! I have seen this at a couple of recent Hamfests as well.

Ain't fooling me!

Subject: [DrakeRadio] R4B Alignment Observations

I posted earlier about the notch alignment on my R4B being
off a bit. I?ve since redone the complete IF alignment of
the radio again, which didn?t fix the notch issue ? it
really does appear to be out some. It will sweep the notch
through the LSB completely, but will only go about 1.5 Khz
into the USB passband. I?m more in the mood to leave it as
is, since life is short, and I need to get on to other
projects ? like refinishing the cabinet.

I put a sweep generator on the IF and looked at the
passband. What I discovered is that if I aligned the
passband tuner (PBT) per the manual instructions I
invariably ended up with a ragged and non-symetrical
passband in the 1.4 and 2.8 Khz positions. This likely
explains why one sideband (usually the USB side) sounded a
bit ?muffled? compared to the LSB side. I finally did the
PBT alignment in the 2.8 Khz bandwidth position with a sweep
generator to get the most flat and symmetrical IF response I
could. The passband shape in the 400 Hz and 1.4 Khz
positions looks quite good also.

AND ? the radio sounds excellent now on both LSB and USB.
Sweep alignment turned out to be admittedly more tedious
than I?d hoped, but IMO it is well worth the effort if you
have the equipment to do it. Maybe what this really means
is that if you don?t think the PBT is messed up in one of
these R4x radios, leave it alone! :)

Grant NQ5T

As a result of extensive research in our modern
laboratories and back-breaking labor by our highly trained
staff, we probably have an answer to the notch filter
problem. To wit:
I got curious because I remembered having some trouble
with the notch filter in the past. I decided to find out how
wide a range it covered. Result: the range was quite
lopsided and the mid frequency did not co-incide with the
zero beat frequency of the calibrator as indicated in the
use and alignment instructions (you have to read both). I

decided to give the slug a slight tweek. I had no more than reached into the back of the shield can when I found that the notch filter did not work at all! Of course first thoughts were that I had destroyed something although I couldn't figure out what. Then a close look at the mechanism brought back a memory: The slug is moved by a cam and lever mechanism at the front of the filter can. The lever moves the slug by means of its spring-like shaft. The socket in the back of the slug, which fits a 1/16" Allen key moves the slug at the point where it is held by the lever. There is a collar in the lever through which this shaft goes. It is not necessary to use the Allen key and, in fact, I am not sure its a good idea. The position of the slug shaft in the collar is what controls the range of frequency over which the notch works. If you find the notch filter does not work at all its probably because the slug is very far off its proper location. Check the amount of the "tail" of the slug shaft sticking out of the collar on the lever, it should not be very short or very long. You can move the slug position forward by holding the lever with the end of a small screwdriver and pushing gently on the slug with the end of an Allen key struck into the back of the shield can. To move the slug toward the front panel grip the tail of the shaft as it comes from the front of the collar with a small pair of needle nose pliers and pull it gently forward while holding the lever with the small screwdriver or similar tool. It takes very little movement but if you go too far its easy enough to go back. At some point you should get the slug to the position where the filter notches out a zero beat signal from the calibrator with the knob pointing straight up. A small deviation will cause the range of the notch to be limited on one or the other side. This is not a difficult adjustment but its tedious to get right. When its centered the range of the notch is about 2.5 khz either side of zero beat. One would think it capable of a wider range but that's it. This is enough to null out most signals when using the 2.5 khz bandwidth but will not make the ends of the 4.8 khz when the pass band tuner is used. Then it will notch out signals about half-way across the band pass. I don't know how stable this adjustment is but I probably never centered it exactly so whatever error I found was probably the result of the original adjustment and not drift. In any case it was a few years ago.
My notch filter has some back lash in the adjustment, probably due to the end of the shaft rubbing something or perhaps just the slug itself. When exactly notched using a little fine tuning its possible to get the calibrator signal down to where its inaudible. The pot associated with the notch should be carefully adjusted for maximum notch depth. If your filter has the sort of back-lash mine does use the

main tuning to get exactly in the notch. The pot and the tuning interact slightly so get the best notch depth you can and then adjust the tuning slightly to get it deeper. After a couple of iterations the notch will be very deep. The pot adjustment seems to be quite stable.

How do I get into these things?

I have been selling old model airplane engines on eBay for about 6 years.

We started pricing them at about 60% of what the reference books said they were worth. NO BUYERS!

One of our club members told us to start them a $9.99. THIS GAVE ME GAS!

But it works. We generally will get good prices for them. One very rare engine sold for $3500. Another for $2500.

Basing your starting price on what you see on other eBay auctions is a wasted effort.

If you want a minimum price your best option is to use a "Buy-It-Now". If it does not sell, you want TOO MUCH!

It’s good there are modern laboratories :)

The lopsided notch is certainly the problem. The one on this R4B tunes from around 45-46 kHz (I didn’t actually make note of the exact low side freq.), up through only 51.5 kHz. Definitely not symmetrical around 50 Khz.

It appears that there is enough cable length to lift the notch assembly partly out of the radio to work on it – at least get it up to the point that the working spaces are a bit less tight, and get a better look at that bushing.

From: Mike Bryce
Topic: 19870 Message: 19880

Guys,

I feel that some of the TV shows, like the American pickers and storage wars, has created a mindset that everything old must be worth lots of money.

I looked at the ebay ad. It is complete, has all the knobs, not the right ones, but all the knobs. And, perhaps, if the guy has been dealing with old stuff, not necessarily radios, then to him the chassis is in good condition.

Value, like beauty, is in the eye of the beholder.

There's a TR-22 for $100, and I saw a SR1 for $500.

or my favorite Drake ebay ad

the UV-3 listed for $999 with a touch tone mic. The seller went into a long detailed description on how much money you could save on your cell phone bills because you could make phone calls with this radio.

Subject: Re: [DrakeRadio] R4B Alignment Observations

It?s good there are modern laboratories :)

The lopsided notch is certainly the problem. The one on this R4B tunes from around 45-46 kHz (I didn?t actually make note of the exact low side freq.), up through only 51.5 kHz. Definitely not symmetrical around 50 Khz.

It appears that there is enough cable length to lift the notch assembly partly out of the radio to work on it ? at least get it up to the point that the working spaces are a bit less tight, and get a better look at that bushing.

Grant NQ5T

My first interpretation was that you were not getting a notch at all, evidently a mistake on my part. Its possible, as I found out, to get the slug so far from where it belongs to make it seem the filter is disabled. In fact, this is done deliberately in the "OFF" position.
The tuning for the notch is done by a cam and lever arrangement that moves the slug in the coil. The range of frequencies is determined mainly by the amount of motion the cam allows. You can see the cam at the front of the assembly. The cam is a wedge shaped disc with a notch at one point. The notch is to push the slug well out of its normal position to provide an OFF position by detuning the filter. It seems to move the notch perhaps six or eight Khz from the IF frequency. The measured range on my T4XB is about 2.5 khz either side of center, center being the zero beat frequency for the calibrator. This is independent of the pass band tuning or bandwidth but is most easily observed in the 4.8 khz bandwidth and by moving the PBT to each end of its range. The range of null frequencies will not be symmetrical around zero if the slug is not carefully adjusted to null the zero beat signal when its exactly in the center of its range (knob pointing straight up). Because of the backlash in the adjustment its touchy to get it right but it seems to stay put once you do. The range is pretty much limited to that marked on the front panel. At some point, when turning the knob clockwise it will encounter the

OFF notch and pull the knob the rest of the way into it.
I think the design of the cam was chosen to provide a
wide enough range for most uses without making the
adjustment too finicky.
I am not sure what causes the backlash in mine and
don't know if its a common problem. The cam and lever
arrangement does not seem to be the source. I think perhaps
there is a slight resistance to the motion of the slug
which, in combination with the springiness of the slug
shaft, will cause the slug to jump as its moved. The
backlash makes it difficult to get the null exactly on a
signal but it can be done by slight variation of the main
tuning. This works at least for CW where the slight change
in beat note is not important.
I am also aware of the lack of symmetry of the band
pass filter. I do not have a sweeper but found that after
adjusting according to the book I could touch up the slugs
slightly in the 2.4 khz position to get it better. It does
make a noticeable improvement in the sound on both sidebands
and does not seem to affect the narrower bandwidths
significantly.
FWIW, I've found the best tool for adjusting the slugs
is an alligator clip. I can clip on the end of a shaft, turn
it as necessary, and let go of it without any backlash or
other change. Others use a socket type adjuster but there is
really no flat on the end of the shaft and pushing the
adjuster on or pulling it off can move the slugs a lot.
I've also found that the PBT tuning does vary slightly
as the set warms up so suggest letting the receiver run for
perhaps an hour before making a final adjustment. This is
probably much longer than it takes to reach equilibrium but
seems to be a good practice with any tube set.

One other thought: The linearity of frequency of the
notch filter will depend on both the curve of the cam and
the way the coil is wound. Since the high and low frequency
limits seem to be about the same radial distance from zero
it appears that its intended to be linear. However, I can't
tell if its done by means of the cam or if the coil is wound
such as to compensate from the square-law inductance change
needed to vary the frequency. A coil with variable spacing
is the method used in the Drake and Collins VFO's and may be
used here since Drake knew how to make them.

Grant NQ5T

Since you have a sweeper it would be interesting to know if the shape of the pass band tuner changes any as its tuned. Perhaps you already made this measurement. I can't tell on mine if there is any change. I did a crude measurement by running the PBT across the calibrator signal and using the S-meter with the AVC in FAST to look at the relative flatness of the pass band and where it began to cut off. On mine its relatively flat but I wonder if this is a valid measurement. I will play with this some more and see what I find but a good sweeper would assure a valid measurement.
Note that the change in bandwidth is done by varying the mutual coupling by means of changing the coupling capacitors. This is similar to the method used in some Hallicrafters receivers and has the same characteristic that the expansion is not symmetrical as shown in the selectivity curves in the handbook. This is also probably the reason that the indicator lines on the PBT indicator are not centered and are offset toward the right (USB side). Again, the frequency of the tuned circuits will vary inversely with the square root of the inductance. I have never seen the coils used in the tuner so don't know if they are wound with linear or square-law spacing.
The method of providing for PBT in the Drake R4B is to vary the tuning of the resonant circuits in the filter. This is in distinction to the method used in the Collins 75A-4

and possibly elsewhere (TMC converters?) of varying a conversion oscillator. In the 75A-4 the main tuning oscillator and the conversion oscillator are coupled mechanically so that they change at the same rate. I think this is done electronically in some other receivers or converters. Collins and TMC use fixed frequency filters so the dual variable oscillator method is the only practical way to obtain PBT and to use the same filter for both sidebands. The Drake T4C uses crystal lattice filters, which are fixed frequency and uses separate filters for upper and lower sideband. One can get around this by using a single filter with a switchable fixed frequency conversion oscillator and fixed offsets to the main local oscillator.

The parasitic chokes have been the same since the 1940's!

They are normally a few turns of enameled wire wound on a 47ohm or 51ohm 2W resistor. They are not critical. They are to stop VHF parasitic oscillation.

Almost certainly someone changed them after manufacture. No reason to change them, as nothing
else in the PA stages have changed over the years.

Every T-4X(any) and TR-3/4(any) I have seen in the last 50 years had 47 ohm, 2W resistors with 6
turns of #16 solid copper tinned wire space-wound around it.

47 ohm, 2W resistors are getting harder to find, and I suspect someone just used what they had,
not thinking that the value mattered.

A few years ago I went to a local garage sale that was running for 3 days and had mentioned they had ham gear. Unfortunately I couldn't make it until the afternoon of the third day. Sitting on a table was a Hallicrafters SX-101 in typical condition. Some paint scrapes and scuffs on the cabinet. Front panel was dusty. Knobs needed cleaning. I pulled open the top lid and the inside was typical, dusty and the usual grime and light discoloration of the chassis. There was a yellow post-it note that said "$420". I thought that was an unusual number and I politely asked how they came to that figure? "Oh well, there was one of these on ebay that sold last week for $450 so we used that as a reference and lowered it a bit because we want to sell this one". "We've had a lot of guys look at it, but no takers yet".

I went home and looked and sure enough one had recently sold on ebay for $450. However, it was as close to mint as you would find. It must have had a dust cover on it when it wasn't being used. All of the paper caps had been replaced. it had been aligned, etc. Not a single scratch or scrape anywhere.

Guys,

I feel that some of the TV shows, like the American pickers and storage wars, has created a mindset that everything old must be worth lots of money.

I looked at the ebay ad. It is complete, has all the knobs, not the right ones, but all the knobs. And, perhaps, if the guy has been dealing with old stuff, not necessarily radios, then to him the chassis is in good condition.

Value, like beauty, is in the eye of the beholder.

There's a TR-22 for $100, and I saw a SR1 for $500.

or my favorite Drake ebay ad

the UV-3 listed for $999 with a touch tone mic. The seller went into a long detailed description on how much money you could save on your cell phone bills because you could make phone calls with this radio.

It does not, at least within the normal tuning range. It looks virtually textbook, and slides nicely around the 50 kHz center. The end dots are pretty well right on in terms of placing the passband in the right place relative to the 50 kHz BFO.

I did use the very sophisticated, finely honed, NIST-tracable, alligator clip tool on the PBT inductors ;) Initially I had to use quite a bit of force to “break” the slugs free to rotate and used pair of surgical clamps to do that, but after they freed up they turned easily with the alligator clip, which needs to be clamped right on the tip of the spring. The alignment adjustment is very touchy – just a tweak off on one slug or other can cause quite a significant change in symmetry and passband ripple in the 2.8 kHz position. I ended up with nice looking passbands everywhere except the 4.8 Khz position, but even that is passable – just not quite as flat. There could possibly be more work done, but I’m happy enough where everything came out.

I just replaced the 2n3877 that drives the NE-2 on the dial index marker, so that works again. Maybe while the primer coats and finish paint are drying on the cabinet this week, I’ll pull the notch assembly and tackle that last remaining issue. Even if the little rubber bushing that holds the spring has dried out and disintegrates, there’s always hot glue :)

Just joined the group since I just picked up a T-4XC, R-4c,mn-2000 tuner and speaker with PS for the T04xc. it is in superb condition and after a close visual inside and out I took the chance to plug it all in. I have great results receives and transmits well and have been playing most of the weekend including many great QSOs with good reports. just one minor question about tuning.

I am getting the typical output on all bands but the final tuning range concerns me on 20-15-10m the Plate dip seems to be right near the top at close to the 10 mark (minimum capacitance) 80-40 are both in the 6 and 8 range respectively.
is this normal or should I be looking for bad capacitors. I haven't really looked at the schematic yet so just guessing some may have drifted high with time.

Topic: 19898 Message: 19898

HELLO ALL,
I GOT MY HANDS ON A TR-4CW rit, HAD MY FIRST ONE IN THE MID 80'S. I WAS HAPPY TO GET ANOTHER ONE IN GREAT CONDITION. IT ALL SEEMED TO GOOD TO BE TRUE. THEN I STARTED TO MAKE IT MINE. YOU KNOW, CLEAN IT UP AND CHECK IT OUT. WELL I FOUND THE R45 BURNED PRETTY WELL AND WHATEVER RESISTOR IS DIRECTLY ABOVE IT WAS CRACKED. IT FELL APART DURING REMOVAL. IT IS TAKING TO MUCH CURRENT TO SET THE PLATE AMP METER TO .100. I HAVE CHECKED MOST EVERYTHING I CAN DREAM UP AND HAVE ORDERED THE SERVICE PART LOCATOR CD.
UPON METER INSPECTION I NOTICED THE COIL OF THE AMP METER IS DARK, ALMOST BLACK. THE METER OTHER THAN NOT READING CORRECTLY IS SLUGGISH AND DOESNT RETURN TO ZERO EASILY. COMPARING THE COILS OF THE TWO METERS, THE S METER AND THE AMP METER I NOTICE THE S METER IS NICE AND GREEN. QUESTION??? IS THE COIL IN MY AMP METER BURNED UP?? DOES ANYONE HAVE ONE I CAN GET?

I have a T4XB so it may not be quite the same but I
believe the final amp is very similar. Mine requires the
plate tuning to be right at the top when the load is minimum
as it is when you start tuning. As I increase the load the
plate tuning comes down (counter-clockwise) enough to have
good range. I have a full set of crystals in the receiver
(an R4B) and use them to transceive over the range not
covered by the single standard crystal in the transmitter. I
am able to tune up right at 29.7 mhz although there isn't
much margin there. I don't know if this is normal but at
least there is another transmitter that's like yours.

This is not new. I see it at surplus and estate auctions that I have been attending for many years. The idea is to get people into the bidding war and only then the frenzy starts. An auctioneer can start at a high, but reasonable, price and beg for bidders to no avail. But as he goes lower and lower with his opening price he will hit a point (usually insanely low) where people start jumping into the fray. The item will very often end up selling significantly higher than where the auctioneer first tried to start it.

This is how auctions work. It seems like most people who sell on eBay don't understand this. People that base salling prices on completed eBay auctions don't understand auction frenzy. People who have suffered auction frenzy understand buyer's remorse....

Been there, done that. :)

Actually, the PLATE and TUNE knobs fit to the flats on their respective shafts. The couplings from the shafts to the variable caps are likewise keyed to the flats.

I have found that improper setting of the neutralization will cause the PLATE tuning to be pushed to near the clockwise limit - which, despite the high number on the scale, is actually near minimum capacitance.

Many, many hams have changed their finals themselves, without checking and adjusting the neutralization. This cap is only a few picofarads and it's adjustment is fairly critical.

You can check by verifying whether or not maximum power out coincides with the dip in plate current. If the two don't, you'll need to adjust the neutralizing cap.

Boy I feel dumb hah hah I just had a quick gander at the neutralization and it does seem to be out a bit. the peak power is not quite at the dip on 10m. when I have time tonight I will make the adjustment ive done it on many rigs but none of these but see it is the manual I'm a little embarrassed that I didn't think to check it at the beginning as one should with first test of any lucky find.

without trying to read all the treads what are the chances of finding the correct accessory crystals for the WARC bands and for 28.0-28.5, not a real big need but if they are out there I may consider it. also it'd be nice to find a narrow filter for CW

19906. CAL signal weak on high bands. Alignment?

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-08 13:03:52 UTC
From: <rochep@...>
Topic: 19906 Message: 19906

I think I remember reading here that an ALIGNED R4 will have nice strong calibrator signals on all bands. Using a dummy load antenna, on 3.5 MHZ band my CAL signal is about 20 db over S9, but drops down to about S5 on the meter on 28.5 MHz band (of course peaking signal on pre-selector). It gets stronger as I go down in frequency, but it is only over S9 on 80 and 40 meters. I don't have a good signal generator and did poor mans "alignment" peaking the trimmers, but it did not make much difference. Ideas? Tubes TEST good on my lousy Superior tester, but ... ...

Paul -

The R-4 has a 12BZ6 in the Calibrator, a 'low noise IF' tube. All later R-4A/B models used the
12BA6, an 'RF amplifier' tube. Since the later models have stronger CAL signals at the higher
frequencies ... It's an easy swap, you have to swap the leads on Pins 2 and 7.

On the other hand, S-5 is plenty of signal on 10M!

Only a GOOD and calibrated signal generator, used properly, can answer your question definitively.

>
> Maybe while the primer coats and finish paint are drying on the cabinet this week, I'll pull the notch assembly and tackle that last remaining issue. Even if the little rubber bushing that holds the spring has dried out and disintegrates, there's always hot glue :)

Sometimes when a task looks like it might be difficult it ends up being very easy.

I lifted the notch assembly out of the R4B. It was only necessary to temporarily remove V2 to allow it to slide out and up after removing the 3 screws that hold it in place. At that point, the adjustment spring is easy to get to even with fat fingers. (Somehow, I lost control of one of the screws, so my penalty for this good deed will be the fun of crawling around on the floor this morning with a flashlight and a magnet hunting it down).

The spring turned easily in the bushing, which is apparently threaded to match. Only a slight twist to align. I over did it the first time, but found there was no need to be aggressive with it to move the center position a small amount (about 1.5 divisions on the notch scale). In retrospect, it might have been as easy to adjust with a set of tweezers or even a couple of q-tips without pulling the assembly out of the radio. However, it wasn't obvious the bushing was threaded or that the spring would turn freely even if it was.

Actually mine is an R4A, and late model at that. And it IS a 12BA6. I was not so much worried that S5 is not "loud" enough, but whether this lower reading means the sensitivity of my rig is low at these higher frequencies. Is the CAL on 10 meters with a properly aligned R4A supposed to peak over S9?

Paul -

OK. The CAL strength varies considerably on different radios. It also varies considerably from
point to point on the same band.

I have to admit that I really haven't paid attention to it as I've never considered it a valid
test of the receiver's alignment. My R-4B just produced an S-8 CAL signal on 10M with the antenna shorted by the antenna switch.

I wouldn't worry about it!

Lane,

How are you implementing a digital receiver during the RF tune stage of the transmitter? Are you monitoring the transmitter while you key down or what? I haven't tried anything other that the tune for max Plate current, this sounds interesting.

You have mentioned your maximum plate current; what is your maximum plate current during the tune up procedure? During tune up, I am close to 400mA but on SSB voice peaks never reach 200mA. With that said, the plate current meter is not peak reading so it would never show the true value anyway.

Thanks for the info,

Doug - N9XTF

Subject: [DrakeRadio] Re: Just How Many

Thanks for all the input guys! Yes, I'm a stickler for the Re-Dip and have a fan top mounted over the PA and drawing warm air out. Generally I run the T4X at 100w output on CW and the air being exhausted is warm, not hot.The current is over 200 but under 275 key down. I have also found that adjusting the RF Tune for max signal into a digital receiver gets that important first tuning adjustment right on. 73 from Lane de n8aft

From: Damien Mannix
Topic: 19916 Message: 19916

Hi all,

Garey kindly invited me to join and I am very pleased to do so though a little concerned that I have far too little knowledge to contribute much! The welcome email suggests I introduce myself so here goes.

Got my licence in 1967 and operated SSB on the HF bands until 1975. Used an early commercial SSB transmitter, the British made KW Viceroy, which had an excellent reputation at the time and with which I was very happy. (I wonder if any are still in use?) For receiving I had an immaculate AR88D initially, absolutely marvellous but not designed for SSB of course, followed by an Eddystone 840C which was not designed for SSB either and then a mediocre Star receiver.

G3PTN, designer of the Zygi beam, suggested I find a good Drake R4A. This I did and could not have been more delighted with that receiver which was light years ahead of anything I had used before. So a lifelong Drake fan was born.

In late 1975 I had to move city for job reasons, then I had to move again and yet again. Marriage and bringing up a family occupied time of course and I also started a small business which never really prospered but gave me a good living as long as I worked 60 hours a week and travelled a lot internationally. Ham radio was reduced to scanning Radcom (RSGB monthly mag') when I had time. Suddenly, now retired, I realise 38 years have gone and I do not know where! No idea!

So I am now putting together a station and the main thing missing at the moment is an antenna! So the most important thing comes last? Blame the winter for that. So far I have a very clean TR4, AC4R, RV4C, MS4, MN2700 and even a Drake 7075 Mic'.

Finally I should mention that I have been fortunate enough to make a few contacts recently when on holiday in the Bahamas with the reciprocal call of C6AXE. This confirmed my interest in the World's best hobby, not that I really ever had any doubts. I am rag-chewer rather than a DX man and hope to meet some of you on air.

73 to all,

Damien G3XER

Damien -

Welcome. Don't worry, most folks on here are NOT experts, but that does NOT mean that they can't contribute! Contributions take many forms, sometimes only loosely related to Drake radio
gear!! :-) I believe the only qualifying requirement is that you enjoy using Drake gear. It doesn't hurt if you believe it is the BEST radio equipment, but is not a requirement.

Welcome 'back' to ham radio and the enjoyment of Drake!!

Remember that the calibrator is generating a 100 kHz square wave and you are actually listening to the various harmonics of that signal. As you go up on frequency, the power in the higher harmonics decreases.

If you have access to a signal generator, input a 50 uv signal at 28.8 MHz and you should be at or near S-9.

Damien,
Welcome back to ham radio and Drakes. As others have already said, you will find this a welcoming group, and even dumb as I am, they let me contribute once in a while to things. I too am a consumate rag chewer and hope to work you one day on the air. I have a room FULL of gear, and growing daily literally, so we should have NO trouble, HI.

Again, welcome to the group, and enjoy those Drakes. You have a fine start again. Antenna is next, but don't wait too long on the warm weather or it won't work properly. I put up my beam this winter between storms quite literally but it did warm some!!!!!!!

19924. Antenna and RF Alignment in R4A

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-08 17:15:23 UTC
From: <rochep@...>
Topic: 19924 Message: 19924

I have a question about the Alignment procedure for a late model R4A. In the Antenna and RF Alignment section (Section E) the first step is to place a 10K resistor from side rotor contact of S5C to ground and connect the corresponding contact on S5D to the B+ line. What is the point of doing these steps? I understand removing the antenna (but why a 68 ohm resistor instead of 50 ohm?), but how would “alignment” be affected WITHOUT doing step #1 in the Section E alignment?

And am I reading it correctly that B+ is hooked directly to a contact on S5D?

19925. Re: [DrakeRadio] TR-4CW rit PLATE AMP METER

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-08 17:17:19 UTC
From: Garey Barrell
Topic: 19898 Message: 19925

Dave -

R45 is the meter shunt, and if it opens up, bad things happen to the meter!! The resistor directly above it is the 'fuse' (R127) for the +250 VDC bus.

Just a guess, but I suspect the BIAS supply failed, keying the PA stage, which drew as much current as it could get from the power supply. This overheated R45, and a PA tube that finally
shorted due to overload drew too much current from the +250 V bus, frying R127.

R127 is there to protect the wiring harness from this type of failure. R127 is 27 ohm, 1/2W.
Do NOT replace with a larger resistor!! It really needs to be a carbon composition type for maximum protection. A melted wiring harness = donor radio.

Also check resistors R42, R43, R44, R93, R121, 167, R176, R177 and R178 for value and condition. A general examination of the entire radio would be a good idea, looking for any burned or otherwise damaged components.

The meter is the same in ALL TR-4/C radios. NOT the same as the TR-3. Sounds like it's probably been killed.

R45 should also be carbon comp, or ceramic comp, or 'flameproof' wirewound for best results.
Once R45 and the meter have been replaced, you'll need to set and measure the current drawn by
the PA at idle, then select a resistor for R13* that makes the meter read 0.100A.

Damien
I might add, that I am likely one of the least experienced, at repair work, here on the list. A couple of years back, I ran into a unique situation, where I did something stupid, and burned up a friend's R4C, which he was wanting to sell. I wound up paying full price, for the radio I had broken. Since my repair knowledge was very limited, and certainly I was more familiar, and comfortable, working in a transmitter, than a receiver, I suggested that since it was otherwise a seemingly good radio, that maybe I ought to part it out, in attempt to get as much of my cost, back out of it, as I could. I am color blind, and wire color codes, always frightened the heck out of me. It's not that I wanted to part it out, but my wallet was overtaking my thought process, at that point.
After a proper chastising, from a few of the good members here, and encouragement from others, who were convinced that they could help guide me through it, I tackled the issue. It turned out to need a transformer, and some diodes in the PS. AND, gave me enough confidence, that I tackled two other receivers, shortly after that.
Now, I sold the receiver, for about what I paid for it (I think I sold it for $10 less than I paid), and really only lost the cost of the parts that I broke. A pretty decent deal, since it kept a very nice R4C in use. But, the best part, was when the fellow who purchased it, called back, and said that he was using it, and liked the receive so much, that he decided to try comparing it, with his Kenwood TS-950SDX. When he did so, he found the R4C, to be a superior receiver to both it, and an Icom IC-756ProIII.
One of the other receivers that I tackled, because of the wonderful guidance I received here, was a Collins 75A-4. When I sold it, the purchaser, a Collins Collector, said it was the best receiver in his shack, at the time. The third, is the Hammarlund HQ-150, that currently graces my shack, as my only remaining tube type receiver, in everyday use.
I have THIS GROUP, to thank, for the help and encouragement. My best advice is this. If/when you do any work, on your Drakes, please, take AMPLE NUMBERS of good resolution photos, and post descriptions of your problems, solutions, and results here. You will have access to an invaluable resource, in this group.
Even though I have recently sold most all of my Drake equipment, with the rest soon to follow, as well as most of my Collins gear, I will remain a member here, as this is, as mentioned, the finest group, of it's type, available, anywhere.

Hello all!

I'm looking for a ac-4 for my TX4B my question is does the transmitter gain anything or lose anything from a 110v or 220v AC-4? Should I strive for the 220v AC-4 version or is the 110v version OK?

Paul -

This is because the inductors in this area are 'critically coupled', and when adjusting one, the
other must be detuned to prevent interaction. The two 10k resistors are essentially just connected across the Primaries of T3 and T4, spoiling the 'Q'.

Some just peak the two coils alternately, but this can result in a 'double-hump' passband or a
single 'hump' rather than the single wide passband desired.

Yes, the 'other' end of T3 is connected to the +150 bus. And the 'other' end of T4 is connected
to ground.

I have no idea why the 68 ohm resistor. Probably what the tech had on the bench. NOT critical,
within reason.

The standard 120 VAC AC-4 is fine. The 240V version is for Europe and other countries that have
a 240 VAC primary power.

Dave -

Amps draw ten to twenty times more current from the power line than the T-4X(any).

Ohm's Opinion clarifies this. P = E x I. For a given device twice the voltage only takes half
the current for the same amount of power.

The problem with heavy current devices such as amplifiers is that for a given wire size and length the voltage drop (lost in the wire) is doubled at 120 over 240 VAC power.

Thanks Garey!!

I wasn't really trying to compare it to a amplifier in the traditional way. With that said I never put much thought in the voltage drop in a amplifier until you just squared me away .... thank you!!!!

Subject: [DrakeRadio] Damien G3XER delighted to join the group

Hi all,

Garey kindly invited me to join and I am very pleased to do so though a little concerned that I have far too little knowledge to contribute much! The welcome email suggests I introduce myself so here goes.

Got my licence in 1967 and operated SSB on the HF bands until 1975. Used an early commercial SSB transmitter, the British made KW Viceroy, which had an excellent reputation at the time and with which I was very happy. (I wonder if any are still in use?) For receiving I had an immaculate AR88D initially, absolutely marvellous but not designed for SSB of course, followed by an Eddystone 840C which was not designed for SSB either and then a mediocre Star receiver.

G3PTN, designer of the Zygi beam, suggested I find a good Drake R4A. This I did and could not have been more delighted with that receiver which was light years ahead of anything I had used before. So a lifelong Drake fan was born.

In late 1975 I had to move city for job reasons, then I had to move again and yet again. Marriage and bringing up a family occupied time of course and I also started a small business which never really prospered but gave me a good living as long as I worked 60 hours a week and travelled a lot internationally. Ham radio was reduced to scanning Radcom (RSGB monthly mag') when I had time. Suddenly, now retired, I realise 38 years have gone and I do not know where! No idea!

So I am now putting together a station and the main thing missing at the moment is an antenna! So the most important thing comes last? Blame the winter for that. So far I have a very clean TR4, AC4R, RV4C, MS4, MN2700 and even a Drake 7075 Mic'.

Finally I should mention that I have been fortunate enough to make a few contacts recently when on holiday in the Bahamas with the reciprocal call of C6AXE. This confirmed my interest in the World's best hobby, not that I really ever had any doubts. I am rag-chewer rather than a DX man and hope to meet some of you on air.

73 to all,

Damien G3XER

All - I'm hoping that someone on the list has a Drake 2-C with the 2-NB installed. I'm looking for a few simple dimensions. These are:
1 - Overall HxWxD of the enclosure
2 - Distance from the left side, bottom edge of the enclosure, to the top of the pins on the
connector
3 - Distance from the back/front of the enclosure to the same top pin (the two that are closer together) closest to that edge.
I already have the dimensions of the 4-pin connector as it is the same as is on the 2-AC crystal calibrator right?

Thanks in advance for any assistance. 73 - ken

19935. TR-4C Receiver Problem

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-08 23:57:15 UTC
From: <f_canuso@...>
Topic: 19935 Message: 19935

When I powered up my TR-4C today the receiver audio came on normally. However, after a couple of minutes a thumping noise was heard in the speaker and the S meter needle moved quickly to the extreme right side of the scale and got stuck in that position. The receiver continued to work normally (signals could be heard at a normal audio level) but the thumping noise continued to be heard intermittently.

I removed the meter assembly, freed up the S meter needle by simply removing the top of the meter case and reinstalled the meters. Upon powering up the radio, the same thing occurred as described above. Any suggestions regarding the cause and fix for this problem would be greatly appreciated.

Thanks and 73,
Tony (N2ATB)

From: David Nichols
Topic: 19898 Message: 19936

I BOUGHT THIS FROM A GUY OVER IN IDAHO A FEW WEEKS AGO. IT LOOKS GREAT AND NOT JUST FOR ITS AGE. IT LOOKS CLEAN INSIDE AND OUT. I EVEN HAD SEVERAL QSO'S WITH IT BEFORE I DECIDED TO LOOK DEEPER INTO IT. I HAD TO SEE HOW IT WORKED BEFORE I COULD GET AN IDEA OF ANY PROBLEMS. I HAVE NEW METERS ON THE WAY THANKS TO DAVID AND HOPE I WILL SEE A MARKED DIFFERENCE WITH IT. I ALSO HAVE THE CORRECT RESISTOR FOR R45 ON THE WAY. THE OTHER PARTS LOOK OK AND I DONT SEE ANY EVIDENCE OF A CATASTROPHIC FAILURE. MY AC-4 HAS THE HEATH KIT SHOP BOARD IN IT AND CHECKS OUT RIGHT. IF I HADNT BEEN USING MY MAGNIFIER WITH THE LIGHT UNDER IT I WOULD HAVE NEVER SEEN THE CRACK IN R127 BUT I DIDNT HAVE ANY TROUBLE SEEING THE BURN ON R45. THE FUN PART MAY BE FINDING THE CORRECT VALUE FOR R13. I HAVENT MENTIONED SOMEONE INSTALLED A JUMPER ON THE SLIDE SWITCH FOR R13. I TOOK THE SWITCH APART AND DEOXED IT, THE SILVER LOOKS CLEAN NOW AND IT IS WORKING FINE. WHERE IS THE BEST SPOT TO
MEASURE THE IDLE CURRENT, BEFORE R45, OR FURTHER BACK? OR JUST BEFORE THE METER SAY ON THE SLIDE SWITCH WHERE R13 GOES?

From: Garey Barrell <k4oah@...>

Subject: Re: [DrakeRadio] TR-4CW rit PLATE AMP METER

Dave -

R45 is the meter shunt, and if it opens up, bad things happen to the meter!! The resistor directly above it is the 'fuse' (R127) for the +250 VDC bus.

Just a guess, but I suspect the BIAS supply failed, keying the PA stage, which drew as much current as it could get from the power supply. This overheated R45, and a PA tube that finally
shorted due to overload drew too much current from the +250 V bus, frying R127.

R127 is there to protect the wiring harness from this type of failure. R127 is 27 ohm, 1/2W.
Do NOT replace with a larger resistor!! It really needs to be a carbon composition type for maximum protection. A melted wiring harness = donor radio.

Also check resistors R42, R43, R44, R93, R121, 167, R176, R177 and R178 for value and condition. A general examination of the entire radio would be a good idea, looking for any burned or otherwise damaged components.

The meter is the same in ALL TR-4/C radios. NOT the same as the TR-3. Sounds like it's probably been killed.

R45 should also be carbon comp, or ceramic comp, or 'flameproof' wirewound for best results.
Once R45 and the meter have been replaced, you'll need to set and measure the current drawn by
the PA at idle, then select a resistor for R13* that makes the meter read 0.100A.

> I GOT MY HANDS ON A TR-4CW rit, HAD MY FIRST ONE IN THE MID 80'S. I WAS HAPPY TO GET ANOTHER ONE IN GREAT CONDITION. IT ALL SEEMED TO GOOD TO BE TRUE. THEN I STARTED TO MAKE IT MINE. YOU KNOW, CLEAN IT UP AND CHECK IT OUT. WELL I FOUND THE R45 BURNED PRETTY WELL AND WHATEVER RESISTOR IS DIRECTLY ABOVE IT WAS CRACKED. IT FELL APART DURING REMOVAL. IT IS TAKING TO MUCH CURRENT TO SET THE PLATE AMP METER TO .100. I HAVE CHECKED MOST EVERYTHING I CAN DREAM UP AND HAVE ORDERED THE SERVICE PART LOCATOR CD.
> UPON METER INSPECTION I NOTICED THE COIL OF THE AMP METER IS DARK, ALMOST BLACK. THE METER OTHER THAN NOT READING CORRECTLY IS SLUGGISH AND DOESNT RETURN TO ZERO EASILY. COMPARING THE COILS OF THE TWO METERS, THE S METER AND THE AMP METER I NOTICE THE S METER IS NICE AND GREEN. QUESTION??? IS THE COIL IN MY AMP METER BURNED UP?? DOES ANYONE HAVE ONE I CAN GET?

I need to ask a question before I start looking for the problem. I have a very nice inside and out 2B with Q-multiplier that does not seem to do a very good job of muting itself when used my Apache and Dowkey. From everyone's past experience is this usually related to :

A. Bad or weak tube
B. out of spec components
C. cold solder joint
Tnx and 73

19940. Re: [DrakeRadio] Need 15m Crystal for TR-4

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-09 13:45:13 UTC
From: Claude Welschbillig
Topic: 12987 Message: 19940

Hello Garey,

How do you do?

It's been some time that I haven't contacted you as I didn't do anything on my Drake stations.

Meanwhile I have a new DXCC antenna and some modern rigs but still a lot of tube transceivers.

I got a TR-4C on ebay. The transmitter sections is clearly better than my TR-4 but it has got some other problems which I'm trying to check...

First there is some problem with the frequencies:

The RX frequencies as well as the TX frequencies for several bands are completely wrong:

15 m 21 MHz gives 21.5X MHz as well as TX and RX
10m 28 MHz gives 28.5X (RX and TX)
28.5 MHz gives 29.0X (RX and TX)
whereas 29.1 MHz is correct!!

I changed the crystals,it is not them. Did you come upon such a problem and do you have an idea what it could be?

Greetings from Carcassonne

Claude

From: Garey Barrell
Topic: 19938 Message: 19941

This is almost always a leaky capacitor.

The 2-B is muted by increasing the AVC voltage to about -18 VDC, cutting off all AVC controlled
tubes. This is about 10 times the normal, no signal AVC voltage. The voltage increase is accomplished by inserting a bias into the 'ground' end of the AVC circuit. Therefore the MUTE
voltage can increase or decrease instantaneously rather than waiting for the time delay capacitor to charge or discharge.

I'd start by checking the voltage at Pin 1 of V8 (-19 VDC). If low, sub the 8BN8. If still low,
proceed through C69, C80, R51 to find the problem. This is a very high impedance circuit, so it
doesn't take much to drag that voltage down. One obscure problem that has shown up is leakage
from the resistive element of R50 to the case (ground).

Let us know what you find!

19943. Re: [DrakeRadio] Need 15m Crystal for TR-4

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-09 15:46:03 UTC
From: Garey Barrell
Topic: 12987 Message: 19943

Hello Claude -

I'm not sure I understand your problem.

The coverage of the receiver and transmitter are both controlled by one crystal.

The 80 and 20M bands do not require ANY crystal as they are generated by their respective 'difference' and 'sum' mixer products.

The CAR OSC runs at 9.000 MHz. The PTO varies from 4.9 to 5.5 MHz. So if the PTO is set to 5.000, the mixer outputs are at 9 + 5 = 14 MHz., and 9 - 5 = 4 MHz.

The other bands require an intermediate mixer with a crystal LO. For 40M, the 5.500 PTO is mixed with 21.5 MHz, resulting in an intermediate frequency of 16 MHz. This is then mixed with
the 9.000 MHz CAR OSC for a 7.000 MHz output.

For 15M, the 5.5 PTO is mixed with 35.5 MHz to produce 30 MHz. Mixed with 9.000 for 21.000 MHz
output.

For 10M, the 5.5 PTO is mixed with 42.5, 43.0 or 43.6 MHz to produce 42.5 - 5.5 = 37 - 9.00 =
28.000; 43 - 5.5 = 37.5 - 9 = 28.500; 43.6 - 5.5 = 38.100 - 9.00 = 29.1 MHz.

It sounds like either the crystals are wrong, or in the wrong sockets. They go in order from
the left edge of the chassis, i.e., 21.5, 35.5, 42.5, 43.0 and 43.5 MHz.

If the PTO tunes from 4.9 to 5.5 MHz, which it obviously does since the 80 and 40M bands are
correct, then the only other factor is the frequency of the crystal oscillator.

??

My answer is "D" : " The standby switch is in the receive position"
. Or maybe the switch is bad or someone has shorted the contacts so
that the normally open contacts in the standby mode are actually closed
as in the receive mode. I have a 2C now and it has been quite a while
since I used my 2B but I would bet that either the dow key relay is not
opening the contacts on transmit or somewhere there is a something
causing the radio to stay in receive mode when you transmit.

Obi-Wan Barrell, I keep my mouth shut on the tube gear. You are clearly the Jedi Master there. I come out of the woodwork for 7-Line comments (and responses to unsubstantiated allegations). But I'm usually watching. Just ignore those black helicopters.

I was distracted for a few days by VK9MT. And the W1AW obsession continues. This will go down as the "lost year" WRT anything really productive getting done.

Oh, and my soldering station went down Sunday. Had to order a new heater from Mouser. Ever seen anyone use a Weller 140 Watt gun on a TR-7 circuit board? So now you have to put up with me until my parts come in...

So what's new with you? :D

Tom -

What's the s/n on the unit? I can send you the correct schematic.

R187 is a 1k trimpot. Similar units are available from Mouser, Digi-Key, etc. under the Bourns
or CTS or ...

774-201UR102B
<http://www.mouser.com/ProductDetail/CTS-Electronic-Components/201UR102B/?qs=sGAEpiMZZMtC25l1F4XBUxzPolMWh3JUEwEZTefNNOw%3d>

is a mouser part number.

You might want to take a look at my Service supplement CDs at the web address below. A BIG help
in servicing these units.

This pot failing is often a result of excessive current drawn by V15, sometimes due to R92 or C135.
<http://www.mouser.com/ProductDetail/CTS-Electronic-Components/201UR102B/?qs=sGAEpiMZZMtC25l1F4XBUxzPolMWh3JUEwEZTefNNOw%3d>

Hello to all. I just received a Drake TR-4 from another ham that he wasn't using anymore. I swapped him a Yaesu FT-101e that was "hacked up" I really didn't want to try to repair. He needed it for parts and I thought this would be a good swap, which it was. After a little TLC and cleaning I had it on the air.
As for my question, I'm used to tuning up my Kenwood TS-520, but this rig I'm having some difficulty. I followed the manual but I still get a (.6) or higher reading on the meter. I tried adjusting the carrier balance control but I'm not sure if I'm doing it correctly.
And one more thing, I got a few items from an estate sale and in a small box I found that there was about 60 to 70 #12 light/fuse bulbs that are used in some of the Drakes. When I first found the bulbs, I had know idea what they were for, till I got the TR-4. I'm going to keep a few, but does anyone here on this group know someone that would be interested in these bulbs to buy or swap for something?

19953. Very weak signals on narrow filter

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-10 11:53:28 UTC
From: <rochep@...>
Topic: 19953 Message: 19953

When I tune in a station on the 2.4 kc bandwidth setting and then switch to 1.2 kc or 0.4 kc I can now barely hear the station. I did some testing using CAL as the signal on 40 meters

4. 8 kc filter S meter peaks S9+6 dB
2.4 kc filter S meter peaks S9+8 dB
1.2 kc filter S meter peaks S4-S4 dB
0.4 kc filter S meter peaks S5 dB

I tune the passband to get peak reading on each filter setting (they vary slightly from filter to filter). Is it normal for signal strength to drop off so dramatically from the 2.4 kc filter to the 1.2 kc filter? If not, what should I investigate to fix? Hard to do weak signal DXing using a 2.4 kc filter since I can't even hear the signals on teh 0.4 kc filter.

If no one else does, I will trade you something for the #12's.
Invariably when someone new buys a TR4, they show up here looking for a bulb to "fix" their new find, and I can share them with the new Drake folks. I lurk here a lot. Let me know what you need, and I'll see if I have it.

19955. R-4 Notch update

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-10 12:23:18 UTC
From: Steve Wedge
Topic: 19955 Message: 19955

I had a few minutes to play with the notch filter again. At zero beat, the knob is on the last mark. At that point, I can get a really good null with the NOTCH ADJ pot.

Either the coil drifted (not likely) or someone before me messed with it (most likely).

I'm going to try removal from the chassis to adjust the slug and to make sure there's not something mechanical that's off. I need to take the PBT apart anyway to re-grease it.

Paul -

No, that is not normal..... I suspect someone has been 'fixing' the Passband Tuner. This will
occur if the IF frequency is off, but I think you have just been through that. If you are certain of your measurements, alignment is indicated.

Alignment instructions are on the CD in the MISC directory.

Yes, Paul, it is normal...and here's why. If you really enjoy looking at a freshly baked apple pie right out of the oven, it's a beauty to behold. That's the 4.8 setting, a nice wide open window of sound. Now you have company over, and give two of them a piece of that apple pie (2.4 setting)...what's left in the dish are fewer pieces, a smaller "window" for sound to pass through. You have a couple more pieces for yourself (I always eat two) (which is the 1.2 filter) and you only have two pieces left in the plate (a lot narrower passband window)...and in the middle of the night when the wife is sound asleep, you sneak down and eat one more piece, leaving just one more piece in the dish (that's the .4 filter), you realize that the beautiful pie is dang near gone (only 400 cycles to pass your audio through). Therefore, each time you narrow the passband down, you narrow the window of reception. The .4 kHz is designed for CW...the 4.8 for AM, and 2.4 is where I like to listen unless there is a nearby adjacent station interfering, and then I go to 1.2k which is still understandable, but not full audio, but narrow enough to eliminate the nearby interference. That one does require a bit more on the RF gain or the AF gain or both. So in short...I believe it is normal. Let's have a cup of coffee and a piece of pie. 73

Date: 2014-04-10 14:25:31 UTC
From: Steve Wedge
Topic: 19955 Message: 19959

During one of my many ADD moments, I walked over to the bench and gave the whole adjustment thing some thought.

I then removed the frequency window lamp/filter bracket assembly. Having done that, I was able to turn the slug by hand and by nudges with an insulated tool and occasionally needle-nose pliers. I've now got the notch right on 12 o'clock with the calibrator at zero beat. It was about 3 turns off, but there's plenty of adjustment room left, so I'm not going to obsess over why it was off by so much, since it may not have been adjusted (or misadjusted) in half a lifetime.

I get a nice, deep null now. Problem solved.

No, I have not done a complete alignment, I do not have a signal generator of sufficient quality for that (I have a crummy Eico 324). It's good enough for now, maybe can borrow a good one from a fellow PVRC club member. I swapped out a bunch of 12BA6 tubes, none of them changed the values much.

It needs an alignment.

From the R-4 to the R-4B, the PBT circuits are all the same (well, maybe there could be a minor component variation somewhere - but you get the picture). When centred on the signal (in this case, the calibrator), you should not get too much variability in signal strength.

With my freshly-tweaked R-4, on 80 I have S9+35 at 4.8, INCREASING to S9+40 at the other three positions. Still, it's not much of a difference...

Paul, it's pretty easy to do with either a VTVM or scope connected to TP1 and the calibrator.

You're adjusting each slug for a negative max voltage. I usually go through the slugs at least twice to make sure everything's peaked. I won't bore everyone with the setup and the procedure, as it's in the manuals and CD's. I especially wanted to point out that you can use a scope in place of a VTVM.

Thanks. Some of the things I could use is a High impedance mic for the TR-4 or a 3 position coax switch that has unused connections grounded.
Back to my radio, do you know what to look for in the keying circuit that is keeping the transmitter from not staying keyed? It works using the mic that I'm using, but not with a key.

Hi,
You might try lengthening the "Vox delay" control on the side of the
TR4. The CW keying should be using the Vox (6EV7 tube) circuit to key
CW, or if my old mind is thinking wrong, and it often does, and this is
true grid block keying, I'll have to look at the schematic and see which
tube and what components are around the keying circuit. Yours is the
"plain" TR-4, right?? By the way, what is your name?? We usually put
that on so folks get used to who we are and know what to call us.
Welcome to the group, by the way. Also, let me know how many of those
bulbs we are talking about and I'll see what I have to satisfy your
needs there.

Topic: 19953 Message: 19966

Steve,

I HAVE done the passband tuner alignment already, I thought all was OK. I think Garey was suspecting my 50 kc IF was out of alignment. I'll look at my passband tuning alignment again, peaking for signal strength and then "centering" the "swoosh" as per the manual. The fact that you get similar S meter readings on AM and narrow CW filters clearly indicates something is wrong with mine.

(Still managed to work 9M2 at 11pm here on 15 meters last night, best DX with my Drake station yet).

OK. You really don't need a signal generator to do a 'field alignment'. The internal Calibrator is more than adequate for 90% of the job.

The most important thing at the moment is to make sure that the BFO is set to 50 kHz. This can
be done per the manual (VII, a) using the Calibrator and a clip lead, or if you have a counter
you can just count the BFO signal and set to 50.000 kHz.

Then do paragraph b., by just tuning in any Calibrator signal to zero beat and peak T7, 10 and
14. Set AVC to FAST, and detune the PreSelector if necessary to get the signal down to below
S-9. Leave the rest for better test equipment.

Now do the alignment procedure on the CD.

That's good enough for now, see if it resolves the insertion loss of the PB tuner.!

Well, maybe Garey will chime in here anyway, but I went to WB4HFN's site and did a quick readthrough of the theory part of the manual. I was right on both counts, for a change. It does use the sidetone, keyed through the VOX relay tube (6EV7) to key the relays. Play with the VOX gain and delay controls and you should be able to get it to stay keyed like you want. If not, you may have a problem in one of the circuits I mentioned, sidetone, Vox gain or vox delay. Likely it's just an adjustment.

You are probably using push to talk on the mic, which is a horse of another color, as the Rednecks say out here, HI. You have a nice rig there, by the way.

I'm going to assume that what you are seeing is that when you close the key, the relay pulls in
and a short 'dit' is sent and then it drops out. You don't mention it, but I would guess that
you don't have any SIDETONE in the speaker.

IN that case, the most likely problem is V2, the SIDETONE generator.

If you DO have a SIDETONE, be sure that the ANTI-VOX control isn't advanced too far.

IF still no luck, post again with your results!

Hello Garey,

I found your answer by chance on the Yahoo Drake group, which I don't get automatically anymore...

I understand that this is very strange, I see your point but don't understand it either!

Is there anything in common between the 21, 28-28.5, 28.5-29 bands which is not on the 29.1-29.6 band?

The crystals are in the right position and I exchanged them with my TR-4 crystals. They do work well in the TR-4 and the TR-4 crystals make the same error in the TR-4C so I have no reason to believe that the crystals are bad (as was my old 40m crystal on the TR-4 where the new crystal from GB solved the problem).

Greetings

Claude

Hi,
You might try lengthening the "Vox delay" control on the side of the TR4. The CW keying should be using the Vox (6EV7 tube) circuit to key CW, or if my old mind is thinking wrong, and it often does, and this is true grid block keying, I'll have to look at the schematic and see which tube and what components are around the keying circuit. Yours is the "plain" TR-4, right?? By the way, what is your name?? We usually put that on so folks get used to who we are and know what to call us. Welcome to the group, by the way. Also, let me know how many of those bulbs we are talking about and I'll see what I have to satisfy your needs there.

OK, I wasn't sure I had the problem straight.

The 15M crystal is tuned by L5. It may be possible to tune to another spur from the crystal.
These are 3rd overtone crystals, and they are not loaded properly they can get squirrely. Your
might try adjusting L5 while listening on a separate receiver or counter to be sure it's on 35.5 MHz

The 10M question is most likely the result of damaged or missing incremental coils mounted on
the BAND switch. These coils are L3 and L4, and are small 'hairpin' leads right on the switch
terminals. If the end of L3 that is tied to L2 is open, there would be no connection to L2 on
the first two 10M bands. This would not affect 15M however....

See attached photo from my CD.

What you typically get as you narrow a filter is decreased noise, not signal. Since the S-meter reads the total receiver output (signal + noise), the meter will see less 'signal' because the noise is less. Noise is much wider bandwidth than a signal, so you are narrowing the window for noise + signal, with noise being cut first. A CW signal is about 25 hertz in bandwidth. Noise occupies the rest of the .4 or 1.8 or 2.2 or 4.8 kHz windows.

Say, for example and simplicity, a signal is '3' and noise is '2', or signal barely above the noise. Signal + noise is '5' total output.

Then narrow the filter to decrease the window for noise + signal. Since noise has much wider bandwidth than signal, the filter cuts it first and leaves the signal bandwidth pretty much untouched until you get really narrow. So then you have, in this simple example, signal 3 and noise 1. So signal + noise is now '4'---less total output but signal much more the above noise.

Among other things, the differing quality of skirts on filters and how close the IF is centered on the exact desired frequency influences the output of the 'equation). Which, as Steve said, the rig probably needs a close alignment, not necessarily (and not probably) new filters.

With a wide filter, it is hard to distinguish between signal and noise on a meter that inherently has some lag in response time. Ears are much sharper. I hardly ever look at the S meter to give a signal report.

In other words, it is not surprising to see less total output on a meter as you narrow the filter. Bob NZ5A

It needs an alignment.

From the R-4 to the R-4B, the PBT circuits are all the same (well, maybe there could be a minor component variation somewhere - but you get the picture). When centred on the signal (in this case, the calibrator), you should not get too much variability in signal strength.

With my freshly-tweaked R-4, on 80 I have S9+35 at 4.8, INCREASING to S9+40 at the other three positions. Still, it's not much of a difference...

Yes, Paul, it is normal...and here's why. If you really enjoy looking at a freshly baked apple pie right out of the oven, it's a beauty to behold. That's the 4.8 setting, a nice wide open window of sound. Now you have company over, and give two of them a piece of that apple pie (2.4 setting)...what's left in the dish are fewer pieces, a smaller "window" for sound to pass through. You have a couple more pieces for yourself (I always eat two) (which is the 1.2 filter) and you only have two pieces left in the plate (a lot narrower passband window)...and in the middle of the night when the wife is sound asleep, you sneak down and eat one more piece, leaving just one more piece in the dish (that's the .4 filter), you realize that the beautiful pie is dang near gone (only 400 cycles to pass your audio through). Therefore, each time you narrow the passband down, you narrow the window of reception. The .4 kHz is designed for CW...the 4.8 for AM, and 2.4 is where I like to listen unless there is a nearby adjacent station interfering, and then I go to 1.2k which is still understandable, but not full audio, but narrow enough to eliminate the nearby interference. That one does require a bit more on the RF gain or the AF gain or both. So in short...I believe it is normal. Let's have a cup of coffee and a piece of pie. 73

Subject: [DrakeRadio] Very weak signals on narrow filter

When I tune in a station on the 2.4 kc bandwidth setting and then switch to 1.2 kc or 0.4 kc I can now barely hear the station. I did some testing using CAL as the signal on 40 meters

4. 8 kc filter S meter peaks S9+6 dB
2.4 kc filter S meter peaks S9+8 dB
1.2 kc filter S meter peaks S4-S4 dB
0.4 kc filter S meter peaks S5 dB

I tune the passband to get peak reading on each filter setting (they vary slightly from filter to filter). Is it normal for signal strength to drop off so dramatically from the 2.4 kc filter to the 1.2 kc filter? If not, what should I investigate to fix? Hard to do weak signal DXing using a 2.4 kc filter since I can't even hear the signals on teh 0.4 kc filter.

paul

Steve -

Absent mechanical damage, that is very nearly impossible. Bill Frost has said that he can't recall repairing a PB tuner with a bad component on the board.

IF alignment doesn't correct this problem, my next step would be an evaluation of the switch
contacts.

C126 is the 'ground reference' for the entire filter, and if it is faulty the entire filter is
compromised.

Subject: Re: [DrakeRadio] Very weak signals on narrow filter

What you typically get as you narrow a filter is decreased noise, not signal. Since the S-meter reads the total receiver output (signal + noise), the meter will see less 'signal' because the noise is less. Noise is much wider bandwidth than a signal, so you are narrowing the window for noise + signal, with noise being cut first. A CW signal is about 25 hertz in bandwidth. Noise occupies the rest of the .4 or 1.8 or 2.2 or 4.8 kHz windows.

Say, for example and simplicity, a signal is '3' and noise is '2', or signal barely above the noise. Signal + noise is '5' total output.

Then narrow the filter to decrease the window for noise + signal. Since noise has much wider bandwidth than signal, the filter cuts it first and leaves the signal bandwidth pretty much untouched until you get really narrow. So then you have, in this simple example, signal 3 and noise 1. So signal + noise is now '4'---less total output but signal much more the above noise.

Among other things, the differing quality of skirts on filters and how close the IF is centered on the exact desired frequency influences the output of the 'equation). Which, as Steve said, the rig probably needs a close alignment, not necessarily (and not probably) new filters.

With a wide filter, it is hard to distinguish between signal and noise on a meter that inherently has some lag in response time. Ears are much sharper. I hardly ever look at the S meter to give a signal report.

In other words, it is not surprising to see less total output on a meter as you narrow the filter. Bob NZ5A

It needs an alignment.

From the R-4 to the R-4B, the PBT circuits are all the same (well, maybe there could be a minor component variation somewhere - but you get the picture). When centred on the signal (in this case, the calibrator), you should not get too much variability in signal strength.

With my freshly-tweaked R-4, on 80 I have S9+35 at 4.8, INCREASING to S9+40 at the other three positions. Still, it's not much of a difference...

Yes, Paul, it is normal...and here's why. If you really enjoy looking at a freshly baked apple pie right out of the oven, it's a beauty to behold. That's the 4.8 setting, a nice wide open window of sound. Now you have company over, and give two of them a piece of that apple pie (2.4 setting)...what's left in the dish are fewer pieces, a smaller "window" for sound to pass through. You have a couple more pieces for yourself (I always eat two) (which is the 1.2 filter) and you only have two pieces left in the plate (a lot narrower passband window)...and in the middle of the night when the wife is sound asleep, you sneak down and eat one more piece, leaving just one more piece in the dish (that's the .4 filter), you realize that the beautiful pie is dang near gone (only 400 cycles to pass your audio through). Therefore, each time you narrow the passband down, you narrow the window of reception. The .4 kHz is designed for CW...the 4.8 for AM, and 2.4 is where I like to listen unless there is a nearby adjacent station interfering, and then I go to 1.2k which is still understandable, but not full audio, but narrow enough to eliminate the nearby interference. That one does require a bit more on the RF gain or the AF gain or both. So in short...I believe it is normal. Let's have a cup of coffee and a piece of pie. 73

Subject: [DrakeRadio] Very weak signals on narrow filter

When I tune in a station on the 2.4 kc bandwidth setting and then switch to 1.2 kc or 0.4 kc I can now barely hear the station. I did some testing using CAL as the signal on 40 meters

4. 8 kc filter S meter peaks S9+6 dB
2.4 kc filter S meter peaks S9+8 dB
1.2 kc filter S meter peaks S4-S4 dB
0.4 kc filter S meter peaks S5 dB

I tune the passband to get peak reading on each filter setting (they vary slightly from filter to filter). Is it normal for signal strength to drop off so dramatically from the 2.4 kc filter to the 1.2 kc filter? If not, what should I investigate to fix? Hard to do weak signal DXing using a 2.4 kc filter since I can't even hear the signals on teh 0.4 kc filter.

I?ve just spent a couple of days with an R-4B passband filter, looking at it?s behavior on a spectrum analyzer.

Steve is absolutely correct, of course. Presuming the PBT is actually centered on the signal you want, you should not see significant differences S-meter readings between selectivity positions. Small variation would be normal, but the differences you have indicate something isn?t working right.

The radio needs to be aligned.

Yeah, I remember that my PBT was acting strangely, but it was still "sorta" working, with the bad C126. It was most obvious on the narrower settings.

I could not get the last slug to adjust - which is why I took it apart to see which slug was the last in line. Turned out that the one that didn't adjust was the last one in the series.

Yes, I'd say a cap on the PBT board is very unlikely to fail, but it can. You're just more likely to win $50,000 on a scratch ticket

Steve -

Absent mechanical damage, that is very nearly impossible. Bill Frost has said that he can't recall repairing a PB tuner with a bad component on the board.

IF alignment doesn't correct this problem, my next step would be an evaluation of the switch
contacts.

C126 is the 'ground reference' for the entire filter, and if it is faulty the entire filter is
compromised.

Kevin,
Garey, K4OAH, is our resident guru on the tube type Drake gear and his suggestion to check V2 is what I would do. First, if you have access to another V2 tube, I would sub it. I don't have the schematic or manual pulled up, and my TR4 is a TR4C and I'm not sure that the tubes/numbers even come close to matching at this late hour, so I'll not try that, but as Garey said, if you can't hear the sidetone, that's a direct indication that it is the problem. Either the tube, or something within that tube's circuitry that generates the sidetone. Garey makes a neat CD that contains a WEALTH of information for a reasonable price on each of the 4 line rigs. See what he offers at www.k4oah.com and see if it would help you. I have bought them for ALL the rigs I own, as I find them a big help to me finding components, boards, and finding schematics and alignment procedures, etc. Your call, as his advice/help is still free, HI. Look at his postings and report back with what he asks, and you will get the rig operating like it should.

Good luck!!!

19993. TR-7 on AM

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-11 13:23:10 UTC
From: Ed Purvis
Topic: 4547 Message: 19993

I have been using my TR-7 on AM with good results. My understanding is the transmit goes through the stock 2.3kc filter, carrier and one sideband.

Can a 6kc filter be used in place of the stock filter to gain a wider tx bandwidth? Not to be used on SSB.

I am aware of the modification by Jeff Covelli. My TR-7 is almost perfect condition and don't really want to change much from original.

Any input will be appreciated.

Kevin -

Welcome! My Son's name is Kevin, but I won't hold that against you!! :-)

You probably have a bad V2. Not much point doing anything else until you swap in a known good tube.

The socket with the jumper plug in it is for the accessory 4-NB Noise Blanker. If the blanker
is not installed, the jumper must be in there for the receiver to work.

It would be useful to know the s/n of the TR-4 as there are eight (8) different versions.....

Hi Garey,
I started to mention a phrase the "old timers" and I don't me me, the
REAL old timers around here use about the old hound dog on the porch.
They ALWAYS say, let the sleeping hound dawg lie, don't pull his tail if
he "ain't botherin' ya". On Jim Shorney, and your consulting fee, one
just should leave those lie, HI HI.
Good morning Sir!!!

You can put the AM filter in that position but
the carrier will not centered in the passband.
Jim Shorney NU0C posted this in 2008 on the Drakelist:

Hello Garey,

The only element in common to the problem was the band switch S1C. I cleaned the switch around the contacts and the 10 m bands were all ok! Whereas on the 15m band, I didn't get anything at all. The previous owner might have tried some adjustments there, so I tried to adjust L5 and T2 following TR-4C manual. Now it works great!

Now I'm looking for R187 to adjust the S-Meter and can't find it.

Also I am looking for a way to adjust the dials on the TR-4C and haven't found yet!! That was much easier on the TR-4.

By the way, is there a source for new transmitter coils for the TR-4? Also for the PC1-PC2-PC3 resistor-coil suppressors.

Thanks, Garey

Claude

Claude -

Cool! Always nice when one is 'fixed'. :-)

R187 is the blue trimpot just to the right of the AF OUTPUT transformer.

There are one or two flat 'levers' on top of the PTO gearbox. Pressing down on either of these
will release the dial wheel(s) allowing you to rotate them to read correctly.

A list member just mentioned acquiring a large number of spare parts. You might try a direct
email to him for what you need.

20000. R-4B Crystals source?

After a number of years, I am bringing ‘up’ my mint R-4B for use as my primary station receiver. I have a set of 30M xtals for both R-4C & T-4XC. I have NOT been paying proper attention to crystal sources. I would like suggestions for good vendors, and any comments on things to do first, and potential trouble spots. Thanks!

Of course, there are always the big companies, like International Crystal.
But, I have done business, a few times with Bry Carling AF4K bcarling@cfl.rr.com, and found him to be a very good source of crystals. Honest, good prices, fast turnaround, and a member of this group.

Ed,
Most especially, if it's for your primary station receiver, I wouldn't use anyone but International Crystal. Garey gave you the name of the knowledgeable lady, Sara, and the number. They guarantee them to be right on, and they will be. Well worth the money. Still family, ham owned and always has been.

Hi all,
Assume many of you are watching the "new" TR4cw on Epay.
If you haven't done so, go to the parties other listings as there is a
"spare" NB for sale also, along with an RV4, and an MS4. I did not note a PS.
All look to be absolutely "new" so cannot disagree.
Carl wd8nhk

BTW # 310926447712 gets you the TR4cw

Thanks Garey! I've done business with them before-although it's been years-and was quite satisfied back then. Will call 'em. This receiver is such a jewel! I bought it in 1998 from a very nice guy in Canada, and besides the original bill of sale, it even came with the set of labels Drake would include back then (still unused!) Perfect copper. I figure I'll go ahead and get a set of spare tubes, double check that fuse, Caig D5 the switches, and connect a speaker & the HyTower, and see what happens.

Once that is done, I'm doing the Heathkit Shop AC-4 upgrade board, and will then start on the T-4XC. I have your 4 series CDs here somewhere close to the PC Desk.

Hello Garey,

Ok for the R187, it seems to be the right one...but I don't find any levers on the VFO gearbox??
I took the front plate off and the ring on the VFO and managed to adjust the position, but I suppose this isn't the normal way to proceed...

Greetings

Claude

No, it’s an R-4B to be used with a T-4XC. Come to think of that, I’ll probably have to get the 28-28.5 xtal for the T-4XC. I will likely NOT be using this station on SSB. Hence xcve is not going to be needed unless I change my mind. (I have NEVER worked more than 0.5% SSB, if that.)

Speaker scratched from use. Label on noise blanker in 4cw/rit looks like it may have been used somewhere else unless it's just the picture. He says they are all NOS. NOT sure if he knows what NOS is but some of it looks used, very nice but used.

If you buy a crystal for a Drake radio, you will be making a BIG mistake not ordering it from a company like ICM. They have the specs to make it on frequency based on the crystal loading. Sara will charge around $23 for the crystal. The other ham source is a mistake as they are not ground for any specific crystal capacitance loading and they will cost around $16. Buy a crystal made for your radio. (here is more to it then just the marked frequency on the crystal.)

I have a full set of crystals in my R4B for both the WARC bands and 10 meters with the exception of 60 meters. I got the 10 mhz crystal from Bri Carling and the others from International Crystal. Bri is a little cheaper. All work fine. I had no problems with them. I use the receiver to control the transmitter (T4XB) as a tranceiver for all of the above.

There was one, several months ago, that was plugged in and all light up. It was stunning as well, very nice to actually see some of them well preserved.

I’m guessing that someone will pay upwards of $1800 for it. Should we take a pool and see who wins? HiHi

I've mentioned this before, for those who pooh-pooh such lofty prices for a nearly NOS or NOS set: it's what's known in collector circles as a condition rarity. Similar to a MS-68 coin or a common 1960's car with only a couple hundred miles on it. People will pay a very hefty premium for something like this.

I predict $1700.

20017. Re: [DrakeRadio] TR-7 on AM

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-11 20:59:36 UTC
From: Jim Shorney
Topic: 4547 Message: 20017

A variant of Jeff's mod with my changes to center the passband is the way to go. That way your retain proper SSB capability should the need arise. I recently contacted W1AW/7 in Washington on 10 and 15 Meters AM and had the opportunity to ask him for an audio report. He told me that I had "lovely" audio and even picked up on the fact that I was transmitting full DSB AM on a rig that it was not normal to expect that from.

On the outside my rig appears to be perfectly stock, even the STORE switch functions normally. All of the action takes place under the hood.

Both of you are likely in the ballpark :)

There?s always at least one guy who got a NIB perfect something or other and found it (1) while dumpster diving, (2) at a yard sale for $25, (3) laying on the side of the road, etc. I have yet to get that lucky ..

There?s at least one other example floating around eBay right now ? an AN/URR-39. Now this is basically an NC-183D with a speaker and a rack. But it hit over $1200 in under 24 hours, and I?d wager it will sell somewhere north of $2K. It?s essentially new and unused, and you just don?t see NIB stuff from that era or the TR-4CWRit era all that often. Worth a whole lot to collectors who have the money to indulge. One hopes that the people who acquire these kinds of radios will continue to preserve them and keep them in the found condition.

I just hope that some of this good stuff is left after I hit the lottery, and by the time that happens that I still remember who I am :)

Hi Dave,

  Give me a day or two to check my inventory.

  This is for the group as well...
I have acquired a dear friend of mine's estate. I have a huge lot of spare parts, a couple cabinets and 8 boxes full of repair parts and tubes. I also have several complete sets. Here are the sets that I currently have:

Drake ...
Qty 5 - TR-4 xcvr
Qty 4 - TR-4C xcvr
Qty 4 - TR-4Cw xcvr
Qty 4 - T-4XC xmtr
Qty 1 - R-4B rcvr
Qty 2 - R-4C rcvr with upgrades
Qty 1 - R-2C rcvr
Qty 1 - L-4B with P/S
Qty 2 - L-4B without P/S
Qty 2 - RV-4 remote VFO
Qty 2 - RV-4C remote VFO
Qty 4 - MS-4 speaker

Swan 700cx xcvr with P/S

National 109 rcvr and matching speaker

Heathkit DX-40 with matching VF-1 VFO

Heathkit DX-40

Lots of Sure desk mics.

I have cleaned and aligned a TR-4Cw with the matching speaker and power supply and sold it to a friend of mine at work. I'm a communications systems engineer for Motorola in Atlanta. I maintain the big public safety systems and 911 centers.

Anyhow, he is very pleased with the rig. These all look nearly new. Little or no signs of wear.

All I can tell you is that my friend and his father had these up in NY. I'm fairly sure they had an electronics business up there and probably sold Ham Radio gear.

I will be offering this equipment for sale, and spare / repair parts as well. I remember seeing like 20 new relays, a drawer full of the red front lamps and retaining clips, blue plexiglass, pots, filters, circuit boards, knobs, feet, upgrade kits, tons of stuff!

If anyone in the group is looking for specific items, let me know what you need and I'll see if I have it or not.

Thanks for having a look.

Topic: 19953 Message: 20021

I think the problem might be mechanical. I was tweaking/pushing around on some of the caps on the passband tuning board while on 0.4 kc bandwidth setting and my signal REALLY popped up. I suspect switch S1/tuning board might have a bad solder joint/broken wire. How hard it is to get the passband tuning board/switch OFF of the radio?

Topic: 19953 Message: 20022

SUCCESS!! Looking at the passband tuner board and jiggling those caps, I noticed that C4 (the big 0.015 mfd cap from switch to ground) was NOT soldered to the lug on the switch!! It was just looped through!! So a touch of solder and BAM!!! Success. Now when I switch from 4.8 down to 0.4 kc bandwidth I do NOT lose my signal strength!!! Weird! I think this cap is ONLY in the circuit on 0.4 and 1.2 kc settings; these were the settings that were killing me. So all seems good, back to USING the radio!

I don’t doubt that price at all.

In 98’ I paid $1000 for a TR4-CW/rit in at least as good condition as the ebay unit….meaning…..there was not a mark on it.

The only difference I can see is that my unit s/n is several hundred later.

I heard guys talking on 80mtrs about that ‘TR-4 that sold for $1000….what an idiot etc on and on’.

For a while I was wondering if I had lost my mind but mebby not.

No…it is not for sale.

20025. TR-4C No power on 29.1?

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-12 09:03:36 UTC
From: Steve VK2SJA
Topic: 4547 Message: 20025

Hi All,

The "Down-Under" TR-4C restoration is still moving along steadily. Went QRT for a week while I ordered in some 6EA8's from states-side. I had one in V3 that would cause loud crackles and pops occasionally and would do so on demand if you tapped it with a plastic alignment tool.

Having sorted that I have now worked the alignments to the stage that I have the following TX output power on tune:-

3.5 = 200w
7.0 = 200w
14.0 = 200w
21.0 = 160w
28.0 = 120w
28.5 = 120w
29.1 = 2w :-((Yep that's right only two watts)

Main low DC supply voltages don't appear to worry the output any. Of course my watt meter may be reading high but at least I'm in the right ball-park.

I'm so close to getting this right! But still the rig wishes to test me to see if I'm worthy.

So the question is:-

"Why do I have essentially no output on 29.1?"

The 29.1 band position does not appear to "Peak" the RX audio with the RF Tune control. The RX audio gets slightly louder when the RF Tune is maxed out towards the 10 position but no controllable peak as such.

I swapped the 29.1 and 28.5 crystals around in their sockets. I could peak the RF Tune in the 28.5 position with the 29.1 band crystal installed in that socket. I did not try and tune up. The 29.1 band position remained non-peakable (if that's a word) with the 28.5 band crystal installed.

Checked continuity from the 43.6Mhz (29.1 Band) crystal through switch S1B (F) to pin 8 of V1 and it looks good.

So for the moment I'm out of ideas.

Help...

73, Steve.

PS. Just threw both crystals into the XTAL Calibration socket of an old TV Sweep generator. The only means this shack currently has of testing that a crystal oscillates (something I shall have to remedy).

Got 14313.79KHz and 14512.51Khz which looks more or less like the correct fundamental of the 3rd overtone. So I "think" the crystals are both good.

Hi Steve -

Beginning to wonder if you had just chucked it out the window!! :-)

What voltage do you measure on the T.P. for the three 10M crystals?? Seems the problem is in
the oscillator stage since your crystal swap produced the results it did.

If the 10(3) crystal is low, (likely,) try peaking L2. If it comes up to where the others are,
then go back down to see if they are still ok.

The design is that L2 is peaked on the highest band, and then the next two switch positions down
have a small wire loop between contacts to increase the inductance. Of course examine the switch contacts associated with this, but I can't see how this problem could be affected by switch contacts.

Your other band outputs look great, fresh new PA tubes are so nice!!

Never!!! This rig is just too darn good looking for that fate!

I admit at one point I was idly wondering how much it would cost to ship it back stateside to someone like WB4HFN, have it repaired properly and then shipped back. But without checking I guess I could save my money and be in the running for a bid on that mint NOS TR-4CW RIT currently running on greedy-Bay at $990 USD! :-)

But then I wouldn't learn anything. And besides, the machine wouldn't have any "soul" (as added by me) as Bill "Soldersmoke" N2CQR might say.

> What voltage do you measure on the T.P. for the three 10M crystals??

I have the following voltages on the T.P.

(3.5) = +0.8
7 = -2.02
(14) = +0.7
21 = -1.55
28.0 = -0.954
28.5 = -0.994
29.1 = -0.836

This *IS* with L2 peaked for 29.1

What sort of voltage range are we looking for here? The manual doesn't really say.

Steve -

Remember the DrakeRadio mantra .... 'We do this for fun...' 'We do this for fun...' 'We do this for ..... :-)

You could probably buy a counter and scope for the shipping charges!

I normally expect -1 to -2 VDC at the TP. Of course there is no oscillation on 80 and 40M, hence the + voltages.

I don't suppose you have a counter or a receiver that will cover up to 45 MHz.....

VERY strange that the 29.1 MHz crystal works ok in the 28.5 slot and vice versa..... I'm having
a hard time reconciling that..... I interpreted your statement that the radio works ok when
the 29.1 MHz crystal is in the 28.5 slot, and has full output on 29.1 MHz in the 28.5 BAND switch setting??? Do you have a way to generate a signal on say 28.6 and 29.1 MHz to see if the crystals are actually oscillating where they're supposed to?

Hopefully someone else is following this thread and might have an idea.

Topic: 4547 Message: 20032

Hi Garey/All,

Some additional information and a correction;-

Power out on 29.1 is *not* 2 watts but in fact 200 mW. (I had the meter set to 1/10 not x1).

It finally dawned on me to connect the frequency counter to the T.P. I have:-

42.985 MHz for the 43MHz crystal and
43.582 MHz for the 43.6MHz crystal (29.1 band)

So they are both oscillating at about the right place.

I did find an oddity. My TR-4C serial number is 36805. The circuit diagram I have been using, which I think is the latest (SN 42500+) shows R154 as 1.5K and nothing other than L11 connected to pin 6 of V1.

But my radio seems to physically match circuit (SN 35161+) with pin 6 V1 also connected to C9 and S1C (F). But with this circuit R154 is shown as being 560ohms and not 1.5K. Since my +250v is low I changed it. Didn't help any - still only 200mW on 29.1

Should I put it back the way it was?

Off to have some lunch and a coffee while I try and think of something sensible/logical to test next.

73, Steve.

Yes, we do indeed!

> MHz.....

Counter Yes. General coverage SSB receiver? Not really, most of my gear is ham bands only. I do have a scanner that might work at that frequency but it would be FM or AM only.

I did not try and tune up with the crystals in those positions. I just noted that I could peak the RX audio. If you want I can try swap them again and tune up on 29.1 using the 28.5 socket.

> Do you have a way to generate a signal on say 28.6

Steve -

Ah..... That makes me wonder if the PA or Driver stage is not making contact with the inductor
in the third 10M position, 10(3)..

Ensure that L6 and L7 are actually being shorted in the 10(3) position of the BAND switch.

Your radio should match schematic 35161+. Use the correct schematic, we don't need any other
anomalies to distract us or have to account for!!

Hi Garey,

I promise to only use the correct schematic from here on in. Hadn't realized I had the wrong one until I found this oddity and went looking on your most excellent service guide.

Using the internal Marker Out frequency on the afore mentioned TV Sweep Generator I can confirm that plus/minus dial calibration (which I have not done yet) the radio is receiving correctly on both the 28.5 and 29.1 bands.

I'll now swap the crystals 28.5 for 29.1 and see if I can tune up on 29.1 using the 28.5 position.

73, Steve.

20036. Re: [DrakeRadio] TR-4C No power on 29.1?

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-13 03:06:15 UTC
From: Steve VK2SJA
Topic: 4547 Message: 20036

Update:-

Placing the 29.1 crystal in the 28.5 slot caused me to have to readjust L2 as the T.P. voltage went positive. Re-adjusted to -0.855 and attempted to tune up. No different.

Now I need to make a correction to the correction. The power meter I'm using has x1/10th, x1 and x10 scales (blame me I built it). I'm reading 20/10 = 2 watts. So I reported this correctly the first time and then got myself confused. I just swapped over for another el-cheap-o power meter and it also shows about 2 watts. So 2 watts out is correct and not 200mW - sorry about the confusion.

So we *are* making some power. Just not a lot.

I just tried tuning up on 28.5 again after swapping back the crystals into the correct sockets and peaking L2 again. For some reason I'm only making ~= 80 watts this morning not the 120w I made yesterday. And I have NO idea why! This is the thing I find most frustrating. Inexplicable inconsistencies!

Anyway. Suffice to say. We have reasonable power out on 28.5 (and all other bands) but near nothing on 29.1

Still looking...

We do this for fun... We do this for fun... We do this......

73, Steve.

20037. Re: [DrakeRadio] TR-4C No power on 29.1?

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-13 07:00:40 UTC
From: Steve VK2SJA
Topic: 4547 Message: 20037

Another update:-

Well I now have significant power on 29.1, please don't ask how I did it because I don't really know :-(

I decided to start all-over again and do all the alignments from scratch.

After this I now have:-

T.P. voltages:

3.5 = (+0.878)
7.0 = -1.942
14.0 = (+0.870)
21.0 = -1.480
28.0 = -0.913
28.5 = -0.931
29.1 = -0.814

Tuning for max power out I get:-

3.5 ~= 200w
7.0 ~= 200w
14.0 ~= 200w
21.0 ~= 40w
28.0 ~= 60w
28.5 ~= 100w
29.1 ~= 80w

So I now have significant power out on 29.1. But what happened to my beautiful power out figures from yesterday for 21.0, 28.0 and 28.5 which are all down like this:-

21.0 was 160w now 40w
28.0 was 120w now 60w
28.5 was 120w now 100w

Frustration is not the word! (we do this for fun...). Measurement error? Perhaps. But I "think" it comes down to three things:-

1. I truly have no idea what I'm doing! ;-)

2. This time round I did the alignments *without* the alignment dummy load. Previously I had made up a dummy load and carefully followed the book. But I was getting very impatient and it is much quicker to do them without the dummy load of course. I'm with Garey on this one guys. It makes tuning the rig very sharp and somewhat unpredictable (possibly with with double dips). In short I think I'm now tuning it wrong because it's

harder/trickier to do. So I shall laboriously go back and do all the "5-16 MIXER & RF ALIGNMENTS" one more time *with* the dummy load and then see what happens.

3. The 21.0MHz band is possibly down because I've cracked the slug in L6 and can't adjust it. Yes, I was using a proper plastic alignment tool (a cheap one) but it cracked anyway. I'll post a separate WTB on this part but does anyone have any ideas for repair or substitute? I shall have to pull it out and measure it but does anyone know what it's nominal inductance is supposed to be?

Well that's enough chaos from me for one day. Easter Long Weekend next weekend here in Australia and I'm taking the Wife and Kids away on a well deserved holiday. So I'll check back in a couple of weeks.

Very 73, to All.

Steve.

20038. WTB: L6 21MHz Inductor for TR4

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-13 09:21:55 UTC
From: Steve VK2SJA
Topic: 20038 Message: 20038

Hi All,

I'm in need of a L6 inductor for a TR4 as mine has a cracked core and cannot be adjusted. This is used for 21MHz. I'm assuming for the moment that all TR4's have he same L6 part (Garey?) But specifically mine is for a TR-4C.

If anybody has one they can sell me one please e-mail me at:-

vk2sja (at_) bigpond (dot) com

Thanks!

73, Steve.

Steve -

Lacking anything better, I suspect that pretty much any old ferrite core that will fit into the form will do. You may have to pick the old core apart with a dental pick or similar tool to get it out of the coil, but it's already broken, so you can't hurt it much worse - HI. Even if the replacement core is not a precise match, it is a good bet that it will work well enough to get the job done. All you need to do is tune the coil to the correct frequency - how you do it doesn't really matter.

20040. Missing power found (mostly)!

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-13 11:58:58 UTC
From: Steve VK2SJA
Topic: 4547 Message: 20040

Hi All,

Well I did a partial re-alignment again (got motivated after dinner) using a *new* alignment dummy load that I made up. It's is probably my imagination but it does seem somewhat easier to tune up.

But the real culprit turned out to be V3. I had changed it during all the "playing around" today for one of my recently arrived NOS 6EA8 (branded Philips) tubes. Back swapped and "wham" I can now easily hit 100 watts on 28 and 28.5 again and for the first time I can do the same on 29.1.

Sadly 21.0 is still down at 60 odd watts but I'm putting this down to a broke L6 for the moment.

Lesson learnt. Do one thing at a time. Test afterwards and write what you did down!

One step forward (and two back?)

So next step. Repair or replace L6. Then do a full re-alignment yet again. I'm getting better at it :-) And then see what we have left.

Thanks for the help everyone and especially Garey.

BTW. I'll have to check back through the list history to see who it was that suggested it. But a very special thank-you to that person who suggested setting the 9Mhz BFO frequency by injecting a tone modulated carrier and adjusting for the same tone on either sideband. I tried it today. Easiest method I've found yet.

73, Steve

20041. L6 21MHz Inductor for TR4 = Fixed

Topic: 20038 Message: 20041

Hi Jim/All,

I looked at doing that. But the original coil form is so fragile I think that you would destroy it getting the old cracked core out.

Anyway it doesn't matter now.

I found an old 23ch crystal CB radio carcass in the junk box and ripped out a similar sized coil form. My VK5JST Aerial Analyser called the old coil in at about 1000nH at 21Mhz. The one I ripped out of the old CB came in at 750nH. So a couple of experimental re-winds latter and I can now tune properly through the peak on both sides.

The power is back with a vengeance!! I am making way over 150 watts on 21 MHz now. :-)

So I touched up the new coil wire with some clear nail polish. I'll Let it dry overnight and then re-do all the alignments (yet again) another day.

But it would appear that my TR-4C is now making excellent power on all bands.

Just got to get a microphone connected now...

73, Steve.

OK, now let's look in the right place. The problem does NOT appear to be in the BAND OSC stages. Measuring the TP voltage pretty well settled that.

When you come back from your well deserved vacation, we'll start over.....

Way back in the beginning, do you recall the hardware check? Put a screwdriver on every screw in
the thing, be it a ground lug, terminal strip, component board, tube socket, shield, etc., etc.,
and tighten it. IF it's already tight, loosen and re-tighten.

Then go through and put a drop of DeoxIT on each switch tag you can get to, and on wipers where
the tags are inaccessible and exercise them thoroughly.

Perhaps someone has an L6 or L7 from a donor radio.

Then an alignment and look with fresh eyes for discrepancies.

Cool! I didn't read far enough ahead in my email!!

Sounds like you have it under control. Jim is correct any (RF) slug should work fine. There are many different materials used in slugs, but as long as it's from an RF device it should work. If it's the wrong material it may not adjust to peak, or it may change too much with temperature variations, but if it tunes it's probably ok.

Enjoy your vacation without this hanging over your head!!! :-)

Topic: 206 Message: 20044

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

Hi Jim/All,

I looked at doing that. But the original coil form is so
fragile I think
that you would destroy it getting the old cracked core out.

Anyway it doesn't matter now.

I found an old 23ch crystal CB radio carcass in the junk box
and ripped
out a similar sized coil form. My VK5JST Aerial Analyser
called the old
coil in at about 1000nH at 21Mhz. The one I ripped out of
the old CB came
in at 750nH. So a couple of experimental re-winds latter and
I can now
tune properly through the peak on both sides.

The power is back with a vengeance!! I am making way over
150 watts on 21
MHz now. :-)

So I touched up the new coil wire with some clear nail
polish. I'll Let it
dry overnight and then re-do all the alignments (yet again)
another day.

But it would appear that my TR-4C is now making excellent
power on all bands.

Just got to get a microphone connected now...

73, Steve.

20047. New Soon to beDrake 4C Twins Owner

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-13 19:42:09 UTC
From: Whitebear1122
Topic: 206 Message: 20047

I just sent off the money for an excellent condition Drake 4C twins setup so I'm very excited about finally owning this radio after all these years. When I first became interested in Boatanchors back around 1994 or so I wanted to acquire the 4C twins and a Johnson Ranger. I ended up owning 5 Rangers over the years and no 4C twins. Funny how that worked out or didn't work out :) In the past 3-4 years I've sold off over 80% of my radios but I still wanted to get the Drake radios and experience them.

I already have the coveted FS-4 frequency synthesizer that I bought from a good Florida friend 2 years ago. It's been sitting on the shelf waiting for me to buy a radio. I have a Drake W4 wattmeter that I've had since 1970 so that will go nice with the station. I do not have an L-4Basher though. Don't know if I want to get one or not. I think it would be fun to have with this set up. Maybe if I find one within driving distance I'll think again about getting one. I don't think they are easy to safely ship.

I'll post my comments when the radios get here and are hooked up and on the air!

To Garey, George and Ethan,
After going over the 2B and all the items suggested I found one cap that was marginal at best the with it and a new 6U8 I have a happily muted 2B to go with the Apache and HT-40. Thanks for the help guys. Ethan that page you suggested is a gold mine and I will be posting a link on my site referencing your site.

Hi Gents,

My TR-4C plate meter is pretty wild. Swings vigorously back and forth like no tomorrow. Makes tuning for the plate dip kind of hard. I notice in the list archives that this is not an uncommon issue. And that some have had success taming the swings with a capacitor across the meter terminals.

Question for anyone who has had success doing this:-

What value capacitor and type? Polarised elecro Ok in this circuit?
Voltage rating?

Steve -

A small electrolytic should be fine. Since the "positive" meter deflection is only one way, the polarity will be unlikely to reverse. Most meters are marked with a + symbol on one terminal. Simply connect the + of the capacitor to the same point. The amount of damping will depend on the value of the capacitor. Start with 10 uFd or so, and see how it works. you can then adjust upward or downward in value until you get something that works for you. A 10-volt rated cap should be fine, but a higher voltage unit will work too. I would stay with something rated no more than 50 volts, however. This is to make sure the capacitor stays "formed".

Lane, the tuning is driven by the dial cord, so there really isn't any adjustment, per se, but you may make it somewhat lighter if the pulleys in the corner have some lube (dry silicone or graphite - NO OIL!) and the tuning cap bearings have a drop of oil.

Lane -

Actually, there is an adjustment for dial drag on the 2-B. The back end of the MAIN TUNING shaft
has a spring clip on it. If you want more drag, push that clip closer to the rear support to
increase the friction. One way to adjust is to use a small plier, another way is to push
alternately on the clip with a screwdriver, etc. Usually this is sufficient drag. If you want
more, you can put a fiber or cork washer between the clip and the bracket, but that results in a
pretty heavy drag....

Steve -

Yes, it's a type of failure in these meters. Very annoying! :-)

I've wondered if a bit of silicone grease on the bearing(s) might tame it down. That may be what was used originally, and after 40 years of the heat built up in these radios, (especially
without fans!,) the grease just evaporates.

The meter in the 2-NT suffered from this malady from the beginning. Drake in later models added
a 50 uF, 6V electrolytic directly across the meter terminals. Worked quite well. The cap needs
to be a low voltage one, otherwise it will lose capacitance over time.

A thousand years ago, I remember Evans Radio in NH claiming they could find
at least one unsoldered connection in any factory-new Collins radio.

The AC4 has a little short RCA jack on it. To use with an R4A do hook the male cable from the MS4 directly to my R4A or do I connect the male cable from the MS4 to that little RCA female on the AC4? Or are these both essentially the same connections?

Paul, the male RCA cable from the MS4 hooks directly to the R4A. The
little RCA jack on the AC4 is to key a linear amplifier. Drake did it
that way for whatever reason.

Unless I'm mistaken, believe the female RCA phono plug coming out of the AC4 is indeed the speaker connection.

The little two pin female connector on the AC4 is used to key an amplifier.

Paul,
I believe you will plug the MS4 into the back of the R4A.
By memory.
The harness that carried the speaker lead to the AC4 was for the speaker of a TR4. (maybe a TR3 too)

Joe,
I may have mispoken and you are probably right, IF he means the short female jack on the end of the cord end. I had forgotten that one that was often used with the TR4's. I have never seen a speaker jack on an AC4 body though, that would be ALC, would it not (mispoke a bit there anyway, didn't I??). I should have just not responded, HI.

The RCA female on the cable is the speaker connection only for the tr-3 and tr-4 transceivers. It's not connected to anything when used with a transmitter or reciter.

There are two RCA conectors, one is on a short pigtail
from the Cinch-Jones plug at the transmitter side of the
power cable. This is for the loudspeaker for a TR-4 and some
other transceivers. To use it a cable with an RCA male plug
is run from the speaker to the female on the pigtail. It is
used only for the transceivers, not needed for separates.
The other RCA connector is on the chassis of the AC-4
and is for the ALC to the final amplfier. There is also an
odd oblong connector which is for the VOX relay in a final
amplifier. My memory is that this kind of connector was used
for 300 ohm twin lead, the plugs are hard to find so some
other kind of connector is often mounted in its place.

Paul -

Carl was the first to get it right! :-)

The speaker plugs right in to the SPKR jack on the back of the R-4(any).

The RCA pigtail coming out of the AC-4 Jones connector was the speaker output for the TR-3/4(any). Only one plug to deal with when putting in or taking out of the intended MOBILE
location.

PLUS..... The AC-3 and early AC-4 didn't have the two-pin LINEAR connector to switch and external amp. Those of us who were 'early adopters' of the Twins, were known to have done surgery on the Jones connector to change that pigtail over to pins 5 and 8 to access the LINEAR
control contacts in the T-4X.

One other variation is a late Drake modification. The two-pin plug was unobtainium even while
they were still being manufactured, so Drake sold a small kit consisting of a little metal plate
with an RCA jack in the center, and two holes to match up with the mounting holes for the two
pin connector on the AC-4.

Paul

The jack on the AC4 essentially is the audio from the TR4 series transceivers. There is no audio out on the radio itself. So plug the MS4 cable directly into the speaker jack on the R4a receiver.

I'm back. I couldn't get my hands on a V-2 (12av6) but I thought I'd try a few other tubes I could get a hold of that is used in the VOX circuit. Now I couldn't get an exact replacement for V-19(6ev7) but I found that a (6cg7) should work and turned the rig on, and after messing with the VOX controls I was able to KEY the radio with a strait key, BUT! after a few seconds the radio would not un-key. I would have to turn the radio of for a few seconds before turning it back on to get it back to receive
Follow me so far?
Now, am I barking up the wrong tree? Should I find another 12av6 and try that? Do I need to get a 6ev7 and try that?. Is there something else that is going on? (sorry for so many questions)
These Drakes ARE a strange breed, compared to some of the other rigs I've messed with.
But I'm willing to learn. This the part of this hobby I like best besides building stuff.

Well, you didn't say what model but most receivers have
the calibrator connected right at teh antenna terminal or RF
grid input so it shows up on the antenna terminals. Usually
not strong enough to drive a counter but you can hear it on
another receiver. Use a receiver that can hear WWV and use
that to zerobeat the calibrator. This, of course, assumes
the Drake receiver you are asking about won't hear WWV.

No problem. Pleased to be able to contribute something.

By all means "leave well enough alone" but just so you know I found the adjustment pretty easy and smooth. So I wouldn't be too worried about accidentally bumping that alignment cap.

I didn't check it again when stone cold but I imagine it might move around at least a little bit with heat. Which is why the 30 minutes warm up period of course.

73, Steve.

20083. Quality Control Tags

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-15 13:23:41 UTC
From: <baysideanh@...>
Topic: 20083 Message: 20083

Seems to me there was something on the forum a couple of weeks ago pertaining to the fact that someone is collecting the quality Control Tags that Drake placed on their products. I believe they were making a data base recording the information as to manufacturing date, s/n as well as product number. Well I looked high an low for them but was unable to locate them. I remember saving them all, but gave up in disgust as I couldn't find them and accepted the fact I must have thrown them in the garbage can. This past weekend I decided to clean out my operating desk as it had been in disarray for some time and low and behold you wouldn't know what I found. In the bottom drawer there was an open box with nothing in it but some spare tubes. under the box I found five (5) quality control tags from my Drake gear that was purchased at VE Sales in Toronto sometime in the 1970's. Does anyone know who is collecting the information from these as I would gladly send them to the party involved.

Kevin -

OK. I think your 6CG7 is either gassy or a 'sorta' substitute. It IS the same base, but..... The 6EV7 is available from most any of the tube dealers, about $3. You don't need a
6EV7 now, but if you make an order for the 12AV6, you might want a spare.

<www.esrcvacuumtubes.com/☐>

<www.tubesandmore.com>

and many more for about $3-5 each. You need a 12AV6, available from the same sources for a little less. You might also want to add a 12BA6 or two, as that is the other problem tube.

I still think the problem lies in the 12AV6, and there isn't much point in doing anything else
until we eliminate it as the cause.

Doug,
Do you have a lot of trouble with ignition noise or electric fences??
If not, I'm not sure you will find the R4C noise blanker worth the money
it will cost you. They often do go for about that price, and are not
that effective on atmospheric noise, in my experience, only our electric
fences and the old ignitions they were designed for. You might consider
that as well. If I didn't have the fences to deal with, I'd sure sell
mine!!!!

Don,

Yes rural Morgan county Indiana. Electric fences are prevalent as well as a 1950 era power line distribution system.

$200 on top of a $250 receiver is kind of stiff but I figured that would be the outcome. I thought I'd find out if anyone on the group had one before paying EBay prices.

Thanks,

Doug - N9XTF

Thanks, Carl, you are right. Some kinds of power line noise do work
with those too. Doesn't help on my "constant frying" when the really
large lines close to me get dirty insulators, but that doesn't last
long, as they lose money and find those FAST and get busy cleaning and
replacing, HI. Gets their attention when it costs in efficiency or
money, it seems. You are right though, the really bad cases I forget
about (lightening arrestors, transformers, etc). Good point!!

David -

You can get away with just removing the Screen lead from the side of the shield wall under the
chassis. This disables the PA so you don't have to worry about keeping it resonated while
you're working on the low level stuff. It's also handy for the 'easy' way to neutralized the
PA. Be very careful removing the lead from the ceramic feedthrough that the Screen lead solders
to. If stressed mechanically or overheated, they will break or be damaged.. Also important to
remember that there is 700 VDC floating around inside the shield wall of the PA where it comes
through the feedthrough. Just as important, don't forget that there is 260 VDC floating all
over that chassis, top and bottom. Easy to get into bad habits if you're used to working on SS
stuff!!!! A simple mistake CAN be FATAL!

L1, L2, and L5 are adjusted from the top only.

I suppose it depends on the accuracy that you want. With the WWV method you can easily get the calibrator within a couple of Hertz or less at 5 or 10 MHz. Divide that my the harmonic number that you are listening to and that will tell you where the 100 KHz fundamental should be. I don't personally know anyone who has a counter with that kind of resolution. Since the error multiplies with the harmonic, it's best to set it with the highest WWV that you can get a good signal on.

For for example, at 10 MHz (100th harmonic of 100 KHz) an error of 1 KHz (10.001 MHz) in the calibrator signal would work out to a fundamental frequency of 100.01 KHz. That's 10 Hertz. An error of 1 Hz @ 10 MHz would be 10 milliHertz at 100 KHz! (If I did my math right).

Of course, that's probably smaller than the drift spec of the crystal, but you still want the calibrator to be as accurate as possibe.

David -

You can get away with just removing the Screen lead from the side of the shield wall under the
chassis. This disables the PA so you don't have to worry about keeping it resonated while you're working on the low level stuff. It's also handy for the 'easy' way to neutralized the
PA. Be very careful removing the lead from the ceramic feedthrough that the Screen lead solders
to. If stressed mechanically or overheated, they will break or be damaged.. Also important to
remember that there is 700 VDC floating around inside the shield wall of the PA where it comes
through the feedthrough. Just as important, don't forget that there is 260 VDC floating all over that chassis, top and bottom. Easy to get into bad habits if you're used to working on SS
stuff!!!! A simple mistake CAN be FATAL!

L1, L2, and L5 are adjusted from the top only.

From: Joe W2KJ
Topic: 20097 Message: 20108

Howdy Jim:

Yes, Garey did forward the write-up...many thanks.

Here's my problem....without any connection to the SP75 I can adjust the green ALC LED on the TR7 to just illuminate at 9 o'clock on the TR7 mic gain.

When I connect up the SP75 and adjusting R5 on the SP75 I can't get the SP75 LED to illuminate...I need to turn the TR7 mic gain up to at least 11 or 12 o'clock for the SP75 LED to turn on.

There is a big difference between the mic gain setting on the TR7 when NOT connected to the SP75 and when it IS connected to the SP75.

I'm having a hard time finding a sweet spot on the combo without distortion.

BTW: My mike is a Shure 444D and I get excellent audio reports when used with the TR7 or T4XC.

One would think that the mic gain setting on the TR7 wouldn't have to be cranked up higher when connected to the SP75......using the normal unconnected mic gain level on the TR7 and just adjusting R5 on the SP75 would seem reasonable....but that's not the case.

Any ideas/suggestions are most welcomed.

OK. I've never had to replace one..... I tend to think the 'N470' was just what they found,
since I don't see any need for temperature compensation here. Main factors are going to be the
100 or 200 pF @ 2000V. Mouser or Digi-Key probably has something.

There is a list member with a stash of parts, and it's possible he would have some. Unlikely,
but possible.

You're getting your LEDs confused. R5 (MIC GAIN) is used with the noise gate (AUDIO) LED on the SP-75 ONLY. The setting of the TR-7 front panel mic gain control will have no effect on the AUDIO LED. It can't. Conversely, R69 (OUTPUT LEVEL) is used with the ALC LED on the radio to proplerly set the output level. R5 is used ONLY to set the input level to the processor using the AUDIO LED on the front panel of the SP-75. This is critical.

In other words, R5 "tunes the mic to the processor". Forget about the radio for the moment. You need to set the input level to the processor with R5 FIRST. The power button and the MIC button must both be depressed. Once this is set so that the AUDIO LED ON THE SP-75 functions properly with speech as described in the manual, LEAVE R5 ALONE.

Once R5 is properly set, use R69 to adjust the output level of the processor to the radio. This is where you use the ALC LED and match your level to that of the mic alone.

The adjustments MUST be done in that order. Otherwise it will not work right.

With the power button OFF and the MIC button depressed the mic should operate as if it were connected to the radio alone.

One possible area of concern is the mic wiring. Most TR-7s have a 470K resistor between pins 1 and 4 of the mic jack, with pin 4 intended for a high level mic input. The SP-75 has 1 and 4 connected together on the input jack, but only one of these is connected on the output connector. In mine it is pin 1. There will be a level difference from the mic by itself if the SP-75 output connector is wired to a different pin than your mic. This is not a deal-breaker, but you may want to check your mic and make sure the SP-75 output connector is wired the same. The 444D is a high level mic and would typically be used on the TR-7 in high impedance mode connected to pin 4.

If you can't get it to work by following the proper adjustment steps then there is a problem - dirty switches, mic wiring, whatever.

I just got a GORGEOUS T4XB from a local ham here. The copper is FANTASTIC. It works well on all bands (was sold in "unknown" condition). What a find. It is S/N 13,XXX so a very early one.

What are the real differences between the 10 year "newer" T4XC and the older T4XB? I did not have to anything but re-adjust bias on AC4 and then use the T4XB; are there any parts I should replace as a precaution to using this as my primary Drake RX? Does one have better CW characteristics than the other (I don't operate phone). I like having sidetone control on the side (instead of back).

Thanks for any ideas, don't wanna blow anything up.

Yes, that's one of the first T-4XBs... Nice find.

The B and C transmitters are essentially identical. The C has a solid state CAR OSC and provisions for phase locking to the R-4C to eliminate the 'C61 Transceive Align' adjustment and
drift/color coded crystal stuff. The C does offer separate DELAY pots for CW and SSB, which is
nice if you do both. Other than that, fully plug and play. The CAR OSC, RTTY and PTO LAMP jacks
are not used with any but the R-4C.

Bill -

The meter is identical. Only the scale has to be removed from the S-Meter and installed in the
T-4X(any) meter. There is some risk of damaging the meter case, as it IS plastic, but it can be
done with care.

Thanks Garey,

One thing I notice: on the T4XB I hear the oscillator running between my characters in CW (I can hear the sidetone as the LOUD signal, but also the constant oscillator as long as the relay is in the Transmit Position). On my T4XC I do not really notice the oscillator running even between CW characters/words. Is this normal, and why don't I hear the oscillator on the T4XC. TRANSCEIVE switch set to SEPARATE.

Is this with a R4B? Is this the side tone or the
transmitter coming through the receiver. If the latter you
can tune it. If the function switch is not on mute you will
hear the receiver. There is a side tone mod on Garrey's
disc, I am not sure what it is supposed to do but perhaps
cure back wave from the sidetone.
I wish there was a separate adjustment for the side
tone volume since on my rig its too loud when set for the
correct anti-vox level. Not a big deal but would be a
convenience.

20123. Help with TR-4C T2 transformer coil

Date: 2014-04-16 23:57:22 UTC
From: Joao Lopes
Topic: 20123 Message: 20123

Dear all

I have a TR-4C to fix with "T2" 9MHz inj coupler for 15m damaged, I dont know what cause it because I dont know the radio history. Is broken, cracked...

I tried to reconstruct a new coil, but unfortunately I dont have the same tube to wrap the coil and I used a fenolite, but its thickness is bigger almost 2mm more and is for a core of 6mm and not 5mm as original or +- same in inch.

I did and I could get the best Q possible for the coil and then, tune the coil for maximum signal in 15m with the ferrite coil tunning in the middle of the coil.

The problem is that i got more less 20dB below if compared with same signal in other band like 40m (using a external RF generator applied to antenna input).

The practical result is that in 15m I can listen other stations "with a 20db" attenuator on.

Anybody maybe has a T2 injection coupler? Or any other tip to help me?

The next stage will be costruct by hand a new paper tube trying to reach same thickness of original e pray after. The wire I used has the same diameter of original one.

Lots of fun in front.

Aesthetically, if you have a copper chassis receiver, use the B. The C has the advantage of the CAR OSC and PTO LAMP synchronising, but that is lost with a non-C receiver.

Better yet, save the C for a suitable R-4C and have that set of Twins elsewhere on the table! Otherwise, not much difference in the transmitters.

Subject: [DrakeRadio] use my T4XC or T4XB?

I just got a GORGEOUS T4XB from a local ham here. The copper is FANTASTIC. It works well on all bands (was sold in "unknown" condition). What a find. It is S/N 13,XXX so a very early one.

What are the real differences between the 10 year "newer" T4XC and the older T4XB? I did not have to anything but re-adjust bias on AC4 and then use the T4XB; are there any parts I should replace as a precaution to using this as my primary Drake RX? Does one have better CW characteristics than the other (I don't operate phone). I like having sidetone control on the side (instead of back).

Thanks for any ideas, don't wanna blow anything up.

paul

Try bridging a cap across C129. The electrolytic can cap.

20129. Re: Help with TR-4C T2 transformer coil

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-17 08:04:47 UTC
From: Terry Thompson
Topic: 20123 Message: 20129

Lopes,

I had a similar problem with T12 in my TR4 that I purchased on eBay a few years ago. After spending many hours trying to align the rig, I was unable to get T12 to peak properly. TheT12 bottom tuning shaft had been bent, the adjustment slot ruined as well as the coil from improper adjustment with the wrong tool by the previous owner.

Searching the internet, I found a dealer who sells parts from parted-out rigs and saw that although he didn't show any TR4 parts, he had parts for a TR3, including a T12 for $14. I examined the schematics and photos of both rigs in the TR4 manual and online (and on Garey's CD) and decided to order the T12 from him. I installed it, finished my alignment procedures and it works great now. T12 appears to be identical between the TR3 and TR4-just looking at the schematics and photos it looks like T2 is likely the same as well.

The dealer's website is:
http://members.tripod.com/tubes_tubes_tubes/id147.html . I have recently purchased a hallicrafters tuning knob for my SX-100 from him as well and he is very pleasant to deal with and ships items quickly and properly packed. He lists a TR3 T2 transformer for $14 plus shipping. I can't promise that it would be identical, but the fixed capacitor values inside the transformer show as being the same values and the transformer photos appear identical, so I suspect it is worth a try.

Hope this helps and good luck with your repair.

73,

Terry Thompson K7MPP

Richard,

This is with an R4A and indeed it is on mute; it is NOT my transmitted signal. The sidetone is on TOP of that. And sidetone volume are easily adjusted on all TX using ANTI-VOX; it is a pot on the back panel. I just wonder if this is NORMAL or not.

Hi Garey,

I'm not soldering anything anytime soon, I separated my shoulder and fractured my collarbone playing lacrosse last night! But are you recommending jumping across electroltyi C129? Why not just replace it?

What exactly am I hearing in between dots and dashes and if the oscillator is always running why don't I ALWAYS hear the oscillator on my T4XC? This is NOT my spotted signal and NOT my 800 Hz sidetone.

Paul -

WELL!! I don't know how old you are, but "I'M" old enough to know better..... :-) I bet your wife is pleased with you too.....

sorry, just couldn't resist..... Hope you're not in too much pain. I HAVE broken bones 'before' I grew up.... :-) My BEST one was when I was about 15. I was sitting at my operating
desk, and swiveled with my back to the desk looking at something else. I heard a 'new' country
calling CQ, and swiveled around quickly and reached for the key. Only problem was the desk was
a few inches higher than I remembered and I caught my little finger on the edge of the desk,
breaking the bone on the side of my hand. It WAS a new country!! Cast from last two fingertips
up to the middle of my bicep..... But my thumb and first two fingers could still operate
the bug. !

Anyway, back to Drake.

A known failure in Drake series TRANSMITTERS is a dried out C129. The topology is that the SIDETONE audio oscillator V9A is keyed 'on' all the time the relay is energized. This tone is
used to provide the SIDETONE signal and to hold the VOX in transmit. The signal is 'keyed' by
biasing diode D8 either on or off with the keying voltage. The usual failure is that C129 dries
out and the ESR increases considerably, the AF signal is coupled 'around' D8 via the Plate supply to V9B. The degree of deterioration of C129 determines the 'strength' of the backwave.

Obviously, the T-4XC capacitor (C107) is in better condition, so doesn't exhibit the problem. I
realize you say it's not the SIDETONE you are hearing, but this is the most likely fault. This
is why I suggested to bridge the cap to see if that resolves the problem. If it does not, then
we'll have to have some more information!

Feel better.....

I am not as familiar with the A as with the B since I
have a B and have had to work on it. If I understand
correctly the tone is there all the time. If you disconnect
the anti-vox cable does it continue? If its not the side
tone and not feedthrough of the transmitted signal I am
unsure what it is. I wonder if its there all the time even
when the tranmitter is turned off. I think this is really a
question for Garrey but I am trying to isolate it.

Problem solved. As usual Garey was correct, replace C139 and problem went away. WHile I was in there I replaced the other 10 uF electrolytic too (Replaced 60 uF C139 with a 47 uF, I bet that would be fine). Now I seem to have lost the "volume control" for my sidetone gain!! Maybe something wiggled loose, but too much pain (after my brief solder stint) to worry about it.

Oh yeah, I am 51 years old and I SHOULD know better, but I have been playing lacrosse most of my life, so ... ... Shoulder not broken, just dislocated shoulder and dislocated acromioclavicular joint (thats a mouthful). But it still hurts.

TR-4CW
When I turn the rig on the S meter goes to the left and sticks there. I have to tap it to get it to release and return to zero. What stupid thing did I do to get it to do this?
** On another note; I now have a tone I know I shouldnt be hearing. When I turn the calibrator on I can hear a low level tone no matter what frequency I am on. It does of course get pretty loud on the hundreds. However, the low level tone is everywhere all the time with the calibrator turned on.

** I also have low S meter level on 10 meters for alignment adjustment. I can only get an S-4 level. But I am pretty sure I should be able to get something on the line of an S-9 reading with the calibrator on and it is only S-4.

I know I saw someone else working on a tone earlier. I wonder if its the same thing?
Good luck to whomever gets the TR-4 on ebay, mine is 38 serial numbers lower than that one.

20140. AC-4 voltages

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-18 01:13:05 UTC
From: Paul Kraemer
Topic: 20140 Message: 20140

The question sometimes arises "what should the ac / dc voltages in my AC-4 measure"?
I recently recorded them on a typical AC-4. AC and DC voltages recorded
The readings are shown as sss / ddd Where sss is the static no load and ddd is the loaded to 100w output reading on TR-4C
Note that the line voltage here is NOT well regulated and that will affect things. Rather than constantly correcting the line voltage I thought it instructive to just call it as it appeared as it may very well represent typical status quo.
I don't mean to imply these readings are gospel---just typical and YMMV

AC line 120v / 119.4v
ACHV 259v / 252v
ACLV 103v / 101v
AC biaas 95v / 94v
DCHV 729v / 666v
DCLV 251v / 237v
AC fil 13.4v / 13.2v
Note all readings taken in the AC-4 not at the radio end of the cable or in the TR-4

David -

Kind of a wild guess, because I've never seen this, but do you by any chance have a 6AQ5 at V17
rather than a 6AQ5A?

Have you replaced C135? C145B? Value and condition of R92?

Do you have a 6BZ6 at V5?

Have you used DeoxIT on the tube pins, especially V11, 12, 15 and 17??

So turn the Calibrator OFF when you're not using it!! :-) The earlier 'tone case' was different.

Are ALL the 10M Calibrator signals low? Have you tried a different harmonic.?

Try the 10(3) band if you have the crystal for it. Stronger? Weaker?

20144. Re: [DrakeRadio] meter peg

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-18 01:55:03 UTC
From: David Nichols
Topic: 20138 Message: 20144

OK, I do have a 6AQ5A at V17.

I have not replaced any caps, but C135 has been replaced with an electrolytic 47uf @ 50V.
R92, What I can see, looks ok, it measures 291ohms in circuit. (270 ohm +/- 10% called for)
6BZ6 is at V5
I used Deox Gold on all of the tube pins.
I keep the calibrator off if Im not using it.. hi hi But I cant help but believe I did something stupid here during the alignment. It is very easy to crank on the wrong thing if you dont double and tripple check yourself. (at least for me)
Now when I was performing the alignment I noticed T1 didnt seem to have much effect. That is, when I compare it with the other injection adjustments. This is where I first noticed the low level indication. Later on, I still couldnt get a good rise on the 10 meter adjustments. It does tune up nicely on ten. So after I completed the process. I checked on ten to see what reading I could get from the calibrator signal hoping for a good S9 or so and it will only give me a S4.
I have both 10 meter crystals and the band just doesnt like something. I dropped down to 15 and I get a good S9 there with the calibrator signal. I dont have any other crystals to play with. I just got this rig about a month ago. It just needs some TLC.

David -

Kind of a wild guess, because I've never seen this, but do you by any chance have a 6AQ5 at V17
rather than a 6AQ5A?

Have you replaced C135? C145B? Value and condition of R92?

Do you have a 6BZ6 at V5?

Have you used DeoxIT on the tube pins, especially V11, 12, 15 and 17??

So turn the Calibrator OFF when you're not using it!! :-) The earlier 'tone case' was different.

Are ALL the 10M Calibrator signals low? Have you tried a different harmonic.?

Try the 10(3) band if you have the crystal for it. Stronger? Weaker?

I replaced the 6AQ5A with a new tube. Noticed, the S meter no longer moves to the left and sticks. It now rises to the right and settles on zero. I guess tube testers just wont tell you everything.

In the past when I was trying to trouble shoot
something I took similar measurements but did them at the
end of the AC-4 cable while it disconnected from the load
and again inside the transmitter (T4XB) under load. I got
very similar measurements to yours although I think the DC
HV was somewhat lower. This was an AC-4 with the Heathkit
Shop upgrade in it. I think it would be worth checking the
filament voltage at the load end of the cable, I don't think

the other voltages are much effected but filament voltage
might be slightly.

Hi, Name here is Roger, K8CIX, ham for 63 years. I just came into the possession of a very nice
set of Drake Twins. A T-4XB and a R-4B. Believe it or not I use to own a Drake Station in the 70's
and I should not have to ask for help on this matter.

On SSB when I tune in a station to what I believe is normal voice and transmit. I get the same horrible
response, " your off frequency"! I have checked everything I can think of after reading the manuals
cover to cover. I did do the Carrier Oscillator adjustment of C61 and found it off approx. 4 turns. But
this did not fix the problem completely. Using spot and calibrate and checking all three positions,
Separate, Rcvr & Xmtr. all three track perfectly to the same frequency. But when I tune in a station
as I have for over 1/2 a century I still am off frequency by a couple hundred cycles or more.

Is it my old age making me unable to tune in a station anymore or am I missing something?

Roger

Great job, looks good! I was actually thinking about making up some kits just like this, thanks for saving me the time!

Now that these pre-fabbed and LEGAL MOD kits are out there, I could really use a pair of plugs or a factory made cable if someone is willing to part with some!

Regards,
Chris

The most important thing to carry away from measurements of unregulated supplies like this is the expected ranges of the voltages. At 120VAC in, the values can be as much as 5% different. At 750V, this is nearly 40V.

The voltages shown below are certainly within reason.

The difference here being, "Well-used". $400 for a good TR-4CW RIT with speaker and supply is an exceptional deal. Hamfests are good places to find bargains. But so is eBay - you just have to be patient.

$2100 went beyond my prediction of $1700. The set is a true condition rarity and is worth what a collector is willing to pay for it.

A good tube tester works great as a screening device. It can't catch everything.

Had an R-4B that sounded terrible, once. I had tested all the tubes but something wasn't right. That's when I started subbing and found a noisy 12BE6.

It exceeded my prediction as well, goo thing we didn't wager Steve.

I still question the label on the noise blanker. They don't get that way unless heat is present.

David -

You skipped ahead several steps! :-)

The reason is that the stage current of V4, 11 and 15 is compared with the stage current of V17
in the S-Meter bridge. With a 6AQ5A all four tubes are '11 second warm-up' type, allowing the
currents to come up pretty close together. If the 6AQ5A comes up slowly, the meter deflects negative. I'm wondering if the DeoxIT suggestion might work, just a little corrosion on the filament pins that would clear up? If you put the OLD tube back in, is it ok?

Does T1 peak (dropping off on EITHER side of the peak)? It's been a while since I've been in a
TR-4C, but I believe it's a bit broad tuning. Are you using the alignment load as described??
Top and bottom adjustment respond similarly? Since it tunes up in transmit normally, the only
two tubes that are suspect are V4 and V7.

The Calibrator signal is injected by a piece of wire that goes from the Calibrator output to the
BAND switch wafer. The wire is NOT connected to a terminal on the switch, rather it is 'woven'
through two holes in the phenolic, i.e., brought 'close' to the RF Stage input.

> 6BZ6 is at V5
> I used Deox Gold on all of the tube pins.
> I keep the calibrator off if Im not using it.. hi hi But I cant help but believe I did something stupid here during the alignment. It is very easy to crank on the wrong thing if you dont double and tripple check yourself. (at least for me)
> Now when I was performing the alignment I noticed T1 didnt seem to have much effect. That is, when I compare it with the other injection adjustments. This is where I first noticed the low level indication. Later on, I still couldnt get a good rise on the 10 meter adjustments. It does tune up nicely on ten. So after I completed the process. I checked on ten to see what reading I could get from the calibrator signal hoping for a good S9 or so and it will only give me a S4.
> I have both 10 meter crystals and the band just doesnt like something. I dropped down to 15 and I get a good S9 there with the calibrator signal. I dont have any other crystals to play with. I just got this rig about a month ago. It just needs some TLC.

Hello Roger -

Welcome to the group! You have six years on me, so we're in the same 'class'! :-)

The B-Line is my favorite Drake station, and is my 'daily driver'.

To your problem..... perhaps the other station has HIS RIT 'on'!? :-)

The C61 setting should put them on 'exactly' the same frequency. Are the color coded crystals
the same? (Letter at the end of the s/n's). Does your station location have large temperature
swings? Are you certain you're doing the C61 adjustment correctly? You should be able to adjust for 'zero' tweets. It won't stay there, but will typically dither +/-5 Hz.

Some clowns just can't pass up an opportunity to denigrate a tube type station from their lofty
10 digit YaeComWood perch!. The Rettysnitch is appropriate. Check with someone you trust!! :-)

Roger,
Welcome to the group. As Garey said, do the checks on the frequency netting in the manual then just use the gear. The modern frequency controller wizards on the air even tell me I'm off frequency when I'm not exactly on the zero or five as the last digit of the frequency when I call CQ!!!!!!!! I marvel at the ignorance sometimes. Just ignore them and move to the next QSO if they persist, not all will be that way, I assure you.

I am net control of a Collins Net a few times a month on 75M. Join us there if you like with your Drake gear, others often do (me included). I ran the net last night, and most were off frequency much further than that, HI. I tell them that's what the RIT is for on my gear. I always run modern gear as net control for the noise reduction so I can hear the weakest barefoot checkins, but as a "regular" checkin, I exercise my Collins, Drake, Heathkit or other tube gear. We run usually three rounds with stations and some of them change rigs each round!!! Lots of fun, many great sounding old rigs and meets Tuesdays and Thursdays at 8 pm CST around 3805 plus or minus QRM. All interested in old radio gear are welcome. Several check in from this group and are made very welcome there. Sorry Garey for the "C" word, but the welcome is a true one. Chris, Mark, and others can attest to that!! I am net control again next Thursday night, the 24th and again the following Tuesday this month.

Are you using the twins as separates or in
Transceiver? C-61 has an effect only in transceive and
should not affect the tuning when operating separately. In
either case you can hear your own signal on the receiver by
turning off the mute. Use headphones! That will tell you
immediately if there is a change in frequency. About the
only cause I can think of is a change in voltage on the VFO
between Spot and transmitting. Garrey will know if this is
a possible problem in the Drake gear. If you are
zero-beating using the "Spot" function I don't think your
hearing would affect the tuning.

Hank,
Early on, I couldn't figure that out, so I just DON'T contest, HI. It would be very confusing if you ever saw this mess. It is an L-shaped counter top in a room about 15 x 20, actually a "sunroom" built out of part of a covered patio several years ago, and the wife said to build my shack in here and leave her one corner so she could have her painting in here too. Works well, but she didn't get a lot of room, HI. Radios are three levels high about 10 x 15 around the room, and sure nice eye candy, with some SWL gear on an opposing wall.

Lots of fun, but some of it will go in a while, as I get it cleaned inside once again, checked out and working well. It's time to pass some along. Some is on the air several times a month though.

20173. Replacing meter bulb on T4XB

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-18 20:39:02 UTC
From: <rochep@...>
Topic: 20173 Message: 20173

This must have been asked and answered a million times, but I noticed the #47 bulb on my T4XB is VERY dim (tests OK on dial meter) so I want to get it out and take voltage readings (and replace blue filter). But I can't figure out how to EASILY to get the bulb out of the holder. I have completely disassembled the S meter to do it, that must not be right! What am I doing wrong? My fat fingers just can't get in that tiny space to "push down" on the bulb.

paul

20174. POWER OFF

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-18 20:47:11 UTC
From: Garey Barrell
Topic: 20173 Message: 20174

The socket has a clip that slides onto the edge of the meter housing. Just push it off, (POWER
OFF, IF IT SHORTS TO THE HOUSING IT'LL BLOW THE FILAMENT FUSE!,) then slide it back on the housing. Check the socket terminals, they rotate rather freely to make sure neither of them are
touching the housing. THEN apply power.

Forgot... The blue filter is just a narrow strip. When the bulb socket is out, you can pick out
the filter strip. Replace it by curling into a "U" shape and put it back like you found it!

20176. Re: [DrakeRadio] meter peg

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-18 21:15:51 UTC
From: David Nichols
Topic: 20138 Message: 20176

OK, Since the Deox Gold isnt really a cleaner I used the red stuff this time and redone the the gold on all of the tubes.
I have changed out V4 and V7, have not powered up to check anything. I am working on a fan installation. I had wanted to get it to 100% operation before I went for any changes but I am impatient I suppose. Once since I put the new 6AQ5A in i did see the meter go to the left. Im still thinking about that issue. For the most part I am working things out and with advise from you and the group Ill either put the flames out crying on it or fix it. hi hi
During T1 adjustment, the top adjusting screw did all the work. I didnt get any response from the bottom adjustment at all. It also has a little tight spot that doesnt feel right to me. Most of the adjustments in this rig are smooth and the bottom of T1 is not. I may have found one, not sure yet, waiting on reply for that. In any event, I will pull T1 and see what it looks like.
By the way, I pulled C130 apart. I was not having a good time finding a sweet spot with the SSB balance, I cleaned it up and put it back in. First time doing one of those. Installed a new 6GX6 and I heard a spot that made me happy. The sound level differential between USB AND LSB just played with my head.
On the calibrator and the wire to the band switch. I thought that might be why that wire was there. I ran into a wire much like that in an old Hallicrafters S38A if i remember right. Learned not to monkey dead end wires in tube rigs.

Subject: Re: [DrakeRadio] meter peg

David -

You skipped ahead several steps! :-)

The reason is that the stage current of V4, 11 and 15 is compared with the stage current of V17
in the S-Meter bridge. With a 6AQ5A all four tubes are '11 second warm-up' type, allowing the
currents to come up pretty close together. If the 6AQ5A comes up slowly, the meter deflects negative. I'm wondering if the DeoxIT suggestion might work, just a little corrosion on the filament pins that would clear up? If you put the OLD tube back in, is it ok?

Does T1 peak (dropping off on EITHER side of the peak)? It's been a while since I've been in a
TR-4C, but I believe it's a bit broad tuning. Are you using the alignment load as described??
Top and bottom adjustment respond similarly? Since it tunes up in transmit normally, the only

two tubes that are suspect are V4 and V7.

The Calibrator signal is injected by a piece of wire that goes from the Calibrator output to the
BAND switch wafer. The wire is NOT connected to a terminal on the switch, rather it is 'woven'
through two holes in the phenolic, i.e., brought 'close' to the RF Stage input.

> R92, What I can see, looks ok, it measures 291ohms in circuit. (270 ohm +/- 10% called for)
> 6BZ6 is at V5
> I used Deox Gold on all of the tube pins.
> I keep the calibrator off if Im not using it.. hi hi But I cant help but believe I did something stupid here during the alignment. It is very easy to crank on the wrong thing if you dont double and tripple check yourself. (at least for me)
> Now when I was performing the alignment I noticed T1 didnt seem to have much effect. That is, when I compare it with the other injection adjustments. This is where I first noticed the low level indication. Later on, I still couldnt get a good rise on the 10 meter adjustments. It does tune up nicely on ten. So after I completed the process. I checked on ten to see what reading I could get from the calibrator signal hoping for a good S9 or so and it will only give me a S4.
> I have both 10 meter crystals and the band just doesnt like something. I dropped down to 15 and I get a good S9 there with the calibrator signal. I dont have any other crystals to

play with. I just got this rig about a month ago. It just needs some TLC.

With Drake separates, the easy way to know if you are off frequency is to just leave the R-4 on ("ON" position, not "EXT MUTE") and listen to yourself. Its the only way I operate.

I appreciate all the input to my question. I think that I will not worry any longer. Seems that even
if I am the one calling CQ and my call frequency does not end in zero some how when I get an answer
I still seem to be off frequency. Strange since I am the one calling CQ. I check into the noon time net
on 40 meters at 7268.5 and most of the fellows have modern rigs and probably are on frequency
within a few cycles. Anyway if they have a modern rig then they also have a RIT and if I am off a
few cycles then I won't worry. Just hearing the dreaded, "Your off Frequency" drives me crazy.

I guess I am just too old to understand the so called, new rules and it appears my time has passed.

I wonder if there is any chance you?re on frequency but that the alignment is a little off so you sound either muffled or ?tinny? and that?s what the complaint really is about. If it were me, I?d listen to myself and have a trusted friend (e.g. anyone on this list) listen to me.

Just thinking out loud?

Simply inform those curmudgeons, that they must be "Appliance Operators" unable to use the RIT, on their multi thousand dollar rig, nor figure out real ham radio, where one must actually operate their rig.
It's not cellular phones, after all.
Heck, I find that AM broadcast stations, are often off, a little bit, when I tune them in, be it on a boat anchor, or a modern "shack in the box"!

Doug,
I'm not sure what the standard is/was, but 20-25 Hz, is about where I used to typically find KFI AM640, when I'd tune it in, on a Kenwood TS-570S, back when I lived in Lost Angeles. There were times that it seemed more. But, was likely my imagination.

From: Steve Wedge
Topic: 20172 Message: 20184

You probably already know, Lane, that this rig is fully solid-state. It comes with, IIRC, about 8-10 crystals from the factory and you buy and install others to suit your needs.

There can be issues with the power supply/AGC board. Both circuits are on the same board and the power supply generated lots of heat. Check the power resistors on that board when you get it and replace them if they show signs of stress. If it has the power cord, look for signs of stress where the cord goes into the moulded part. Wrap any bare conductors there so that you don't get zapped. Those power cords are made of Unobtanium - I just saw one selling on eBay for about $70.

Removing boards from this set can be a major PITA, so try to avoid doing it. I bought one that needed work from eBay, thinking I'd just put the board back in, and Voila! It was far from "Voila!". I actually borrowed a working SPR-4 from K9SUL so that I could see where all the wires went.

Once I got it running, it played really nice. It will not have the selectivity of an R-4B but its intended purpose was for monitoring SW broadcasts, with capability to copy SSB and CW thrown in.

Got it back together and managed to replace the blue strip. But one thing I noticed, when I use a #47 bulb in the main dial socket, my #47 bulb in the S meter burns bright. But when I put one of the 2BRadioParts blue LED bulbs in the main dial socket, my #47 bulb in the S meter is very weak. Has anyone else noticed this? I do not notice this behavior in my T4XC transmitter, just this T4XB. Strange. But I am going old' school and gonna use a #47 and new blue filter.

David -

On T1..... One of the ways you can get into trouble with these double tuned transformers is if
one slug is in too far, i.e., on 'outside' of resonance, and it bumps into the other slug. You
might try backing that bottom slug all the way out and then go back in watching for the peak.

The converse is also true. If the top slug is in too far and you're on the bottom side, same
problem.

Sounds confusing even to me!! If you have a coil, and the slug starts from way OUT, as you screw it further in, as soon as enough core material is within the field of the coil to hit resonance, you're good. BUT, if you keep turning there will be another resonant point as the
core goes through the coil and starts out the other side. If it's on that second 'exiting' resonance, it may be far enough down to prevent the bottom coil from getting far enough into its
coil to resonate.

Bottom line, if you turn one slug all the way out, and then adjust it in to the 'entry' resonance, and then start with the other slug all the way out and see if you can resonate before
it runs into the other slug.

Too much???

20187. Re: [DrakeRadio] meter peg

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-19 01:41:11 UTC
From: David Nichols
Topic: 20138 Message: 20187

Garey, that sounds interesting I will have to give it a try to see what happens. And by the way, no Im not using the load setup. The consensus seemed to be that it wasnt necessary and it seemed to be another opportunity to screw up. I prefer to learn from other peoples experiences and screw-ups whenever possible. Believe me, Im still stupid enough to have my own screw-up. I had to go to town today but I may get that fan in yet. Then I will play with T1.

David -

On T1..... One of the ways you can get into trouble with these double tuned transformers is if
one slug is in too far, i.e., on 'outside' of resonance, and it bumps into the other slug. You
might try backing that bottom slug all the way out and then go back in watching for the peak.

The converse is also true. If the top slug is in too far and you're on the bottom side, same
problem.

Sounds confusing even to me!! If you have a coil, and the slug starts from way OUT, as you screw it further in, as soon as enough core material is within the field of the coil to hit resonance, you're good. BUT, if you keep turning there will be another resonant point as the
core goes through the coil and starts out the other side. If it's on that second 'exiting' resonance, it may be far enough down to prevent the bottom coil from getting far enough into its
coil to resonate.

Bottom line, if you turn one slug all the way out, and then adjust it in to the 'entry' resonance, and then start with the other slug all the way out and see if you can resonate before
it runs into the other slug.

Too much???

From: Garey Barrell
Topic: 20173 Message: 20188

Paul -

Two things. One, use a #755 bulb instead of the #47. That way you won't ever have to go through this again, and still have 'real' light bulbs.

Two, the stupid LED thingys don't do well in series with a bulb. Those two bulbs ARE in series
in the A and B Lines.

> Got it back together and managed to replace the blue strip. But one thing I noticed, when I use a #47 bulb in the main dial socket, my #47 bulb in the S meter burns bright. But when I put one of the 2BRadioParts blue LED bulbs in the main dial socket, my #47 bulb in the S meter is very weak. Has anyone else noticed this? I do not notice this behavior in my T4XC transmitter, just this T4XB. Strange. But I am going old' school and gonna use a #47 and new blue filter.

The T-4XC has a 2W resistor in series with each bulb so they can turn the VFO bulbs on and off
in TRANSCEIVE.

Garey,
I understand. I might be the same here, if I could
only have one set
out. I am fortunate, and know it, and can have most of
it out. I used
to say all of it, then I went nuts, and now some of it has
to be in the
garage!!!!!!!! Just got to be too much out here in the
"shack" and it's
HUGE.

It's an ADDICTION, but mine has Drake, lots of it, Collins,
Heathkit,
Johnson, Lafayette, Trio, Allied, Knight Kit, and I have
bought a
Central Electronics 20A that hasn't been delivered yet!!!! I
guess I
need treatment, Garey!!!!!!!! I am sure I have
slighted some poor brand
name that I'll see later in the day weeping in the corner,
and I haven't
even mentioned any of the Ten Tec, Elecraft or Japanese
modern wonders
gracing the place. It's a good thing I have a

marvelous, supportive
wife, isn't it??? And, sorry guys, no sisters!!!!!!

David -

You should always use the loads. The 'consensus' on the internet ain't always correct.! the design engineers at Drake knew considerably more about these designs than the 'internet experts'. These are 'critically coupled' dual resonators, and if you just peak them you'll have trouble covering all of the larger bands. Look up 'double tuned' circuits in your Handbook
or on line to eliminate the center peak or the 'swayback' effect from improper tuning.

My favorite is the 'improvement' for VTVMs that move the 1M resistor from the probe tip to the
range switch to eliminate the need for a special probe.... Yeah, right.....

Garey,
I understand. I might be the same here, if I could
only have one set
out. I am fortunate, and know it, and can have most of
it out. I used
to say all of it, then I went nuts, and now some of it has
to be in the
garage!!!!!!! Just got to be too much out here in the
"shack" and it's
HUGE.

It's an ADDICTION, but mine has Drake, lots of it, Collins,
Heathkit,
Johnson, Lafayette, Trio, Allied, Knight Kit, and I have
bought a
Central Electronics 20A that hasn't been delivered yet!!!! I

guess I
need treatment, Garey!!!!!!!! I am sure I have
slighted some poor brand
name that I'll see later in the day weeping in the corner,
and I haven't
even mentioned any of the Ten Tec, Elecraft or Japanese
modern wonders
gracing the place. It's a good thing I have a
marvelous, supportive
wife, isn't it??? And, sorry guys, no sisters!!!!!!
73, back into my cave,
Don, WB5HAK

20193. Re: [DrakeRadio] meter peg

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-19 02:38:08 UTC
From: David Nichols
Topic: 20138 Message: 20193

Ok Garey, I have read it in several places that the load wasnt needed but what you say does make sense. The design team should have known more than anyone what it took to make them work right. I sure dont want to set it up with limitations that cause it to not work as well as it can.
Well how about pulling power from the RV4 plug in for the fan Im installing? Should I just power the fan externally? Im tapping the 12v ac off of pin 7.

David -

You should always use the loads. The 'consensus' on the internet ain't always correct.! the design engineers at Drake knew considerably more about these designs than the 'internet experts'. These are 'critically coupled' dual resonators, and if you just peak them you'll have trouble covering all of the larger bands. Look up 'double tuned' circuits in your Handbook
or on line to eliminate the center peak or the 'swayback' effect from improper tuning.

My favorite is the 'improvement' for VTVMs that move the 1M resistor from the probe tip to the
range switch to eliminate the need for a special probe.... Yeah, right.....

20195. TR7 Screws

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-19 09:16:32 UTC
From: Dieter Horst
Topic: 20195 Message: 20195

Gentlemen,
my nearly finished project TR7 came without cabinet screws. The screws for the bottom plate were missing, too.

I am reluctant to convert everything to metric as I want to keep the radio orginal.
Can anyone tell me which screws were used? I am not so familiar with the American threads.

Sourcing them here in Germany is another story. But I am sure I will not be left alone there either.

20196. 4 Line meter and VFO lighting

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-19 13:23:01 UTC
From: <dj_coffman@...>
Topic: 20196 Message: 20196

I absolutely detest the blue LEDs for Drake lighting. Its a personal OCD thing, the color just does not come close to what I like; this is not a bash on those that do. Its also a big OCD thing when I see people reverse the blue and white filter material, UGH!

The question I have is has anyone attempted to make any type of light reflector to get the lighting to disperse more evenly on the VFO or meter lighting. All of my 4 line stuff has a "Hot Spot" where the bulb sits and then the lighting gets lighter on the VFO window as you move away from that spot. As expected, there is quite a bit of "Wasted" light that lights up the inside of the rig. I wondered if someone had improved the factory reflector the bulb socket mounts to.

Thanks,

Doug - N9XTF

David -

As long as it isn't the fan for your air conditioner, it's fine! :-) The SMALL fan needed doesn't draw any current relative to the filament supply capability. If you can hear the fan
running, it's probably too powerful. All you need is a gentle breeze blowing air AWAY from the
PA cage. If you think of one of the old-time cardboard hand fans they used to hand out in churches before air conditioning, that's about all the air you need. Most use fans running on
about half their rated voltage. 24 VAC 'box' fans go for next to nothing at hamfests, but they
run great on 12 VAC for our purposes. Or a 12 VDC fan on about 6-7 VDC is good. Many cases you
can get by with just a diode in series with the filament voltage, no 'filter cap'. Experiment.
You'll see how little air movement it takes to reduce the cabinet top temperature from too hot
to rest your hand on, to room temperature.

From: Garey Barrell
Topic: 20196 Message: 20198

Doug -

I've found it helps a lot to repaint the reflector a nice bright white. They tend to yellow with age, as do the white diffusers. Gets you back to the truer 'blue-touch-o-green' instead of
the blue-green resulting from those yellowish tints. I've never tried it, but I wonder what polishing the bare aluminum reflector with 'Nevr-Dull' would do?? Also, the #755 bulb in place
of the #47, aside from lasting 'forever', reduces the 'hot-spot' a bit...

You could also try a 'light shield' like was used on the old wood cabinet radios. Spring steel,
kinda like a tube shield that doesn't go 'all the way around', leaving a wide 'slit' on the 'back side' of the bulb. They used it to focus the light on the dial area, here it would be rotated so the slit was facing the reflector (polished?) and blocking the direct glare...

The screws for the top cover are 4-40 machine screws. The bottom plate is held by what I believe to be #4 Type B sheet metal screws. I was just researching that last night, as I lost a couple of the bottom screws. I can get you the length later, as I am on my way out for the morning and don't have time to measure them right now. Both are round head Phillips type.

From: VE3AX/7
Topic: 20172 Message: 20200

Lane:

Congratulations! That looked like a nice example of the SPR-4.

No matter how much use it's had, it would probably benefit from a thorough cleaning of the PTO gear train, lead screw and front bearing race, if not already done by the PO. Read all you can in the reflector archives first, and keep a digital camera handy as you disassemble. You will be glad you took pictures when you go to re-assemble! I've had three SPR-4 PTO's and a T-4XC PTO apart recently and not one was exactly the same mechanically. Drake used slightly different arrangements of plastic spacers in the dial trains throughout the whole 4 line; even the later C-line like dials there were changes. Pay close attention to where the little fibre washers go. Handle with care as they break easily.

I would pick up a few B-5030 transistors on E-Bay and keep on hand. There is one used in the power supply and two on the audio board, at least through mid-range SPR-4's. I have not found any other sources other than John Kriner (TR7dude). They are a weird little device and I have had to replace both the PS device in one radio and the two on the audio board in another. You may want to check your rig as it is a very late one, and I've been told Drake may have changed the audio board to one using EP-487's like the DSR/MSR series. I'd be interested to know if that is the case. The B-5030 BASE is the longer lead – that is not clear in the manual.

As Steve has said, check that power cord, especially right at the molded 5 pin plug. Many will be intermittent there. If it is, there is a pretty easy fix that doesn't deface the radio at all. Involves pulling the 5 pin socket, mounting a small aluminum plate on the inside of the chassis in the same mounting holes, and putting a strain relief for a standard 18 gauge AC line cord there. I have detailed pics of that mod and dimensions of the plate should you need it. And it's entirely reversible should you ever happen across an original line cord in good shape.

Changing electrolytic caps in the SPR-4 may not be as much a concern as, say, the bias cap in the AC-4 power supply, but there are 3 on the B-5030 style audio board and some in the PS section I'd be wary of. That said, I have not done any in my SPR-4 or RR-1's yet here.

Hello Drake Pros...

Found a FB SPR4 on the bay and is to be delivered shortly. It has the NB5 & 100kc calibrator with a full compliment of crystals.

What can the Drake Gurus tell me about the SPR4 receivers? Hints, Kinks, Tips and experience? Marked with Serial #6164.

Please and Thank You....lane in Columbus, Ohio. 73 n8aft SK ..

Jim,
I think you will find that on a true original TR7, the outer case screws are actually a standard slotted head screw, not a phillips head. Many have been changed over the years, but the true original I believe were slotted. I have several one owner rigs, the latest one I haven't picked up yet, but I believe it has never been violated and I will double check that one to be sure and tell you if I am wrong. The last one I have in sight I got from an estate, and the owner was so anal, that I have documentation on EVERYTHING from it's "birth" in the 1980's to the last he did to it, including all the old parts he replaced taped to the documentation!!! It is outfitted as I described.

It really doesn't matter to me, as I don't stay QUITE that original, but Dieter did ask for originality, so I thought I'd risk sticking that in.

Dieter/Jim:

I was pretty sure there were some pan head 4-40 common slot screws there somewhere. So I went to the shack and checked.

TR-7 and TR-5 - both cabinet screws and bottom plate screws are as Jim described - cabinet screws are 4-40 round head Phillips while the bottom plate uses #4 machine screws with the same head.

TR-7A - Cabinet screws are as above - 4-40 machine screws with round head Phillips. But on mine, the bottom plate has #6 machine screws with pan head common slot screws. I suspect they are not original. Oh, woe is me!

MN-2700 - as the TR-7 and TR-5 above.

ALL other accessories I checked; WH-7/CS-7/CW-75/SP-75/P-75/MS-7 - use pan head common slot 4-40 machine screws.

I did not check the amps or the smaller tuners but can if someone really needs that I can.

Dieter - if you can't find them over there let me know and I'll send you some.

Gentlemen,
my nearly finished project TR7 came without cabinet screws. The screws for the bottom plate were missing, too.

I am reluctant to convert everything to metric as I want to keep the radio orginal.
Can anyone tell me which screws were used? I am not so familiar with the American threads.

Sourcing them here in Germany is another story. But I am sure I will not be left alone there either.

Don..I'm glad you said that! I don't know about the later Drake boxes, as I don't have any.

On all my "B" equipment, the screws are all slotted....I have replaced them with Phillips screws (Black) (In stock at the local F&E Fasteners, here in Reno...bought a box of 500..Only $5.00 or so!) and have saved all the slotted screws..not original, I know, but sure makes pulling covers easier (And faster!)

BTW...What was the final selling price of that 'NIB' TR7 that was on eBay? Anyone know?

Well guys,

I fixed this thing a few years back and it's been sitting on the shelf. I decided to fire it up, and whoa, there are issues.

the only mode it works on is AM. Using the calibrator, i can hear a good solid s-9+ signal on 40 meters

However, when I switch to USB or LSB, there is zip audio. A slight bit, but no signal. The s-meter still shows the calibrator.

Seems like the product detector is not working.

yes, I have carrier as the oscillator is singing with more than ample level.

so, before I spend hours trying to track this problem down, any one been down this road before?

Just popped the bottom cover so I haven't got too deep into it yet.

and of course I've wiggled the tubes, all are lit and every thing seems to work but only in AM mode

Just came upstairs.. .somewhat dismayed

it's the 11 tube version and the schematic I have doesn't match

seems the BFO is a small pcb with two transistors mounted.

Using my scope, I found no oscillation on the coil leads when the switch is
in SSB mode

Yes, I have 10v on the other side of 680 ohm resistor. When I go from a.m. mode to sideband mode I have 11 volts going to the BFO board and the collector of transistor Q6 which I think is right behind the large .47 mfd cap.

There was a lot of discussion on this group about SPR-4's and their PTO's and dial mechanisms.

What I would do first is to see if the dial moves freely or not (do not force it, it is not "just stiff" if it does not), and then open the unit to determine which PTO and dial assembly it has.

I would also look at the blue lenses to see how blue they are and which light bulbs work. There are three options, one is to replace them all with #47 bulbs. The second is to replace them with longer lasting bulbs (which I think are slightly redder) and the third is to replace them with LEDs. There are lots of places that sell drop in 6v bayonet light bulbs with LEDs in them. I got mine from superbrightleds.com, but there is also cointaker and the 2b parts has them now too. My advice to you is unless you really want to be as close to factory fresh as possible, replace the S meter and tuning dial bulbs with blue LEDs and the center bulb with a long lasting incandescent one. You may also get an unusual, but useful look replacing the center one with a red LED, I don't know.

Don't expect it to be what it is not. It is really designed for casual listening to shortwave broadcasts in the day the band was not crowded. It does receive USB/LSB and CW, but it is not as sharp as some people would like. Don't expect it to be a modern receiver with narrow filters or DSP and you will be fine. That said, with a good speaker or headphones, it makes a great receiver for listening to moderately strong shortwave broadcasts.

The factory unit did NOT come with the ham bands, and while it works on the ham bands with the right crystals, I don't recommend buying them for it if they are not already in it.

In contrast to Peter, I do NOT recommend doing anything to the power supply, or power cord. If they need work or replacement, I would run a pair of wires from the 12 volt input out one of the spare holes in the rear of the radio and power it from a 12v power supply. The radio itself uses very little power, the rating doubles with the lights on.

If you plan to use headphones, unless you have 1960's vintage headphones, make an adaptor cable with a 1/4" inch mono plug for the radio, and mini socket for your headphones. Put a resistor (40-60 Ohms) in series with the "hot lead".

Geoff.

Doug -

The GUF-1 is the same 'bandwidth' (8 kHz) as the stock 'roofing filter'. BUT it has considerably steeper skirts and greater stop-band attenuation. It 'probably' won't affect the
NB, and was pretty valuable in it's time. With the (comparatively) wide-open spaces of today's
bands, (except on contest days,) I'd question its' value unless you are a contester.

As far as 'Sherwood Testing' goes, it will improve the 'Dynamic Range Wide Spaced' number considerably, but won't make a bit of difference in the 'Dynamic Range Narrow Spaced" number.

20217. Re: [DrakeRadio] TR7 Screws

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-19 19:21:49 UTC
From: Jim Shorney
Topic: 20195 Message: 20217

Interesting. My single-owner R-7A has Philips head screws, and I am sure that the original owner was never inside it. Both of my TR-7s in the 3xxx serial range) have Philips, as well as the other TR-7s I have seen. My SP-75 has the Philips sheet metal screws and AC-4 "feet". As does the CS-7 indoor box that I have. Counted in is an MS-7 with Philips machine screws that I believe also was single-owner. However, the RV-7 that I use has slotted screws. I'm not going to take the other RV-7 out of the box to look at it. So it appears that Philips head are also "true" Drake.

To complete my earlier answer, both screws measure at 1/4 inch in length. The sheet metal screws appear to be "Type B" (blunt) screws, but I have not confirmed this by physical comparison to known samples as of yet. Pointy screws would probably work OK, but there may be a slight difference in the pitch of the thread.

Dang, I forgot to look at my MN-2700 and L-7. I must have too much stuff.

(No, you can't have any of it).

From: Steve Wedge
Topic: 20219 Message: 20219

Saw a few Drake sets at RARSFest today. W8UQ had a decent TR-3/RV-3/AC3 combo. I was tempted but have to get rid of some TR-3's and TR-4's before I take any more on.

Another guy had a decent 2-A. I shoulda pounced on it but I didn't. It was in decent shape.

Another guy had a 2-B full of crystals, decent chassis, with a 2-BQ and a 2-NT. Tried to get a deal and probably would have paid asking except that the 2-B and 2-BQ had "replacement" knobs on them. I thought about how long it would take me to find original knobs and decided to pass.

I did buy an SPR-4 for $125. It was on, not making smoke but could not get so much as a scratch out of the speaker. Told the seller I had no way of telling if this was just a small problem or a lightning hit, so he accepted my offer. Got it home and couldn't get anything out of it for quite a while, until I started twisting the chassis with the covers off. Looks like I'll be going through the screw-tightening ritual. The set is now working and I'm a happy Drake owner

Be very careful with the LED 'bulbs' in the Drake 4-Line radios.

The 'drop-in' replacements ONLY drop-in when the socket is wired directly to a supply voltage.

SOME Drake radios (A and B-Lines) have the dial and meter bulbs in series across 12 VAC. The
LEDs will 'probably' work ok, unless you put a real bulb in one socket and an LED in the other.

Some other radios (T-4XC) have each bulb in series with a big resistor to drop the voltage. Obviously the LEDs draw much less current, and so will see close to 12 VAC. Not good if it's
rated for 6 VAC!

Others (TR-4) have a pot in series with one or two bulbs to 'dim' the panel lamps. Obviously
it's not going to do much for the LED except apply 12 VAC, and the dim will not work.

Still others (SPR-4) have a fixed resistor in series with one bulb and two other bulbs in series. See above!

That's all I can think of off hand. All in all, the #755 bulb is a much better option, and will likely last the life of the radio(s).

Ya'll be careful out there!

Drake probably ran into the same problem we have today. Just try and find a slotted head screw
of any type in your average hardware store. The specialty places have them, but they have to
'go look' as 'they haven't seen any for years'!!

Guys, you are great. It is so much fun reading all your replies.

The sheet metal screws may be difficult to get here. But some local ones may work.

The 4-40s should be available here,at least I found an online shop that seems to have them.

I am not too mad about slotted or phillips. Just did not want to tap a new metric thread as this somehow 'hurts'.

And if you're a real fan of efficiency, like me, you'll find that if you put the receiver on the left and stack it on the MS-4/AC-4, with the transmitter on the right at the same level as the MS-4, the air moved by the fan over the PA cage also significantly cools the transformer area of the receiver

David -

As long as it isn't the fan for your air conditioner, it's fine! :-) The SMALL fan needed doesn't draw any current relative to the filament supply capability. If you can hear the fan
running, it's probably too powerful. All you need is a gentle breeze blowing air AWAY from the
PA cage. If you think of one of the old-time cardboard hand fans they used to hand out in churches before air conditioning, that's about all the air you need. Most use fans running on
about half their rated voltage. 24 VAC 'box' fans go for next to nothing at hamfests, but they
run great on 12 VAC for our purposes. Or a 12 VDC fan on about 6-7 VDC is good. Many cases you
can get by with just a diode in series with the filament voltage, no 'filter cap'. Experiment.
You'll see how little air movement it takes to reduce the cabinet top temperature from too hot
to rest your hand on, to room temperature.

Is that similar to the shields used around the bulbs in the TR-3/TR-4 for the UPPER and LOWER indicators?

Subject: Re: [DrakeRadio] 4 Line meter and VFO lighting

Doug -

I've found it helps a lot to repaint the reflector a nice bright white. They tend to yellow with age, as do the white diffusers. Gets you back to the truer 'blue-touch-o-green' instead of
the blue-green resulting from those yellowish tints. I've never tried it, but I wonder what polishing the bare aluminum reflector with 'Nevr-Dull' would do?? Also, the #755 bulb in place
of the #47, aside from lasting 'forever', reduces the 'hot-spot' a bit...

You could also try a 'light shield' like was used on the old wood cabinet radios. Spring steel,
kinda like a tube shield that doesn't go 'all the way around', leaving a wide 'slit' on the 'back side' of the bulb. They used it to focus the light on the dial area, here it would be rotated so the slit was facing the reflector (polished?) and blocking the direct glare...

>
>
> The question I have is has anyone attempted to make any type of light reflector to get the lighting to disperse more evenly on the VFO or meter lighting. All of my 4 line stuff has a "Hot Spot" where the bulb sits and then the lighting gets lighter on the VFO window as you move away from that spot. As expected, there is quite a bit of "Wasted" light that

lights up the inside of the rig. I wondered if someone had improved the factory reflector the bulb socket mounts to.

20230. Re: [DrakeRadio] The "New" SPR-4

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-19 22:10:07 UTC
From: Steve Wedge
Topic: 20172 Message: 20230

As coincidence would have it, I picked up an SPR-4 today at the Raleigh Hamfest (RARSFest).

The line cord is just like the one K9SUL had, with exposed conductors. I'm going to try and shrink-wrap it and try and prolong its life.

The set does have some intermittent gremlins. Flexing the chassis brings the audio back and then cuts it off. I can see that a PO put an electrolytic in parallel with the can cap, so I'll be disconnecting that can cap as one of the first things.

The PTO does feel as though I need about 80 ft lbs to turn it (just kidding - but it is REALLY stiff!).

Other than that, it has the entire top row of crystal sockets populated and it's playing on all bands! Not bad for $125.

Subject: Re: [DrakeRadio] The "New" SPR-4

Lane:

Congratulations! That looked like a nice example of the SPR-4.

No matter how much use it’s had, it would probably benefit from a thorough cleaning of the PTO gear train, lead screw and front bearing race, if not already done by the PO. Read all you can in the reflector archives first, and keep a digital camera handy as you disassemble. You will be glad you took pictures when you go to re-assemble! I’ve had three SPR-4 PTO’s and a T-4XC PTO apart recently and not one was exactly the same mechanically. Drake used slightly different arrangements of plastic spacers in the dial trains throughout the whole 4 line; even the later C-line like dials there were changes. Pay close attention to where the little fibre washers go. Handle with care as they break easily.

I would pick up a few B-5030 transistors on E-Bay and keep on hand. There is one used in the power supply and two on the audio board, at least through mid-range SPR-4’s. I have not found any other sources other than John Kriner (TR7dude). They are a weird little device and I have had to replace both the PS device in one radio and the two on the audio board in another. You may want to check your rig as it is a very late one, and I’ve been told Drake may have changed the audio board to one using EP-487’s like the DSR/MSR series. I’d be interested to know if that is the case. The B-5030 BASE is the longer lead – that is not clear in the manual.

As Steve has said, check that power cord, especially right at the molded 5 pin plug. Many will be intermittent there. If it is, there is a pretty easy fix that doesn’t deface the radio at all. Involves pulling the 5 pin socket, mounting a small aluminum plate on the inside of the chassis in the same mounting holes, and putting a strain relief for a standard 18 gauge AC line cord there. I have detailed pics of that mod and dimensions of the plate should you need it. And it’s entirely reversible should you ever happen across an original line cord in good shape.

Changing electrolytic caps in the SPR-4 may not be as much a concern as, say, the bias cap in the AC-4 power supply, but there are 3 on the B-5030 style audio board and some in the PS section I’d be wary of. That said, I have not done any in my SPR-4 or RR-1’s yet here.

Subject: [DrakeRadio] strange problem with a drake R4A

Well guys,

I fixed this thing a few years back and it's been sitting on the shelf. I decided to fire it up, and whoa, there are issues.

the only mode it works on is AM. Using the calibrator, i can hear a good solid s-9+ signal on 40 meters

However, when I switch to USB or LSB, there is zip audio. A slight bit, but no signal. The s-meter still shows the calibrator.

Seems like the product detector is not working.

yes, I have carrier as the oscillator is singing with more than ample level.

so, before I spend hours trying to track this problem down, any one been down this road before?

Just popped the bottom cover so I haven't got too deep into it yet.

and of course I've wiggled the tubes, all are lit and every thing seems to work but only in AM mode

20233. RE: [DrakeRadio] R-4C Inrad GUF-1 8KHz first IF

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-19 22:54:38 UTC
From: Doug Coffman
Topic: 20215 Message: 20233

Garey,

Thanks for the information. I typically work 10M, when 10 is dead then I move up to 15M, 17M and then 20M until I find some activity. What I find is that 20M is almost like CB at some points. I typically find an open frequency around 14.260 - 14.270. I will talk there for awhile and then stations will come in 3KHz above and below full well knowing there is activity where I am. Everyone appears to congregate on 20 within a small part of the band. I adjust the passband tuning and change to the 1.5KHz filter to move away from them as best as possible. If the new IF filter has sharper skirts it might be the cat's meow to help with this problem. When I rag-chew on contest days (I very much dislike contests) it is even worse, 10M is definitely worse than CB on those days.

As always, I greatly appreciate the information!

Doug - N9XTF

Subject: Re: [DrakeRadio] R-4C Inrad GUF-1 8KHz first IF

Doug -

The GUF-1 is the same 'bandwidth' (8 kHz) as the stock 'roofing filter'. BUT it has
considerably steeper skirts and greater stop-band attenuation. It 'probably' won't affect the
NB, and was pretty valuable in it's time. With the (comparatively) wide-open spaces of today's
bands, (except on contest days,) I'd question its' value unless you are a contester.

As far as 'Sherwood Testing' goes, it will improve the 'Dynamic Range Wide Spaced' number
considerably, but won't make a bit of difference in the 'Dynamic Range Narrow Spaced" number.

From: <prosolar@...>
Topic: 20235 Message: 20235

What a day!

Turned on my old R4A and it's dead on single sideband. AM works fine. Going to order parts.

Turned on a TR-4, and small puff of smoke came out. No audio (speaker thumps when turned on) and the S-meter is pegged to the right.

No transmit. No relay clicks

I think I'm going to go out in my greenhouse and watch the flowers grow.

What a weekend this has started to be

mike, wb8vge

Thanks for all the input. The rig is about "As New" as one will find. The original #47's had very little wear or solder tip marring which I have found in other old rigs to be an indication of use hours, albeit a crude way to determine. The PTO is spot on as well as the calibration.I have the weighted spinner knob installed now and that is a great improvement. Right now just getting used to it and am having fun using it to tune in Non-Directional Beacons on LW using an active LF Probe. I see the AVC speed problem on CW and plan to change that resistor as well as add the one on the #47 bulb ckt.
The radio came with the original box and documentation including a CD ROM of tech info as well as all mods for this model.
Looks like this rig was bought, used for a month or so and put away somewhere nice.
Today's my 58th birthday, XYL Miss Kim has loaded me up with Drake gear for gifts. She got me a cool "new" TR22C today. It'll be neat just to use it in the local simplex gatherings here even though it is a ricebox, hi.
73 and Thanks from Lane in Columbus...de n8aft sk ..

PS...Looking FWD to Dayton next month.Hope to see some of you there perhaps. Friday is my usual day to attend.

There are many different LED bulbs out there. I have had no trouble with the 6 volt LED replacement bulbs in my SPR-4's, although eventually I was able to order some 755 bulbs. If they go, I probably will not be able to get more of the 755s.
I have also used the 12 volt ones in Ten-Tec gear. I got mine from superbrightleds.com and they were sold specifically as drop in replacements. They work with both AC and DC and work in series.

Note the 6 volt and 12 volt bulbs are different, they are not 6-12 volt bulbs, so they must have the appropriate resistance.

YMMV.

Geoff.

Jim:

That’s what I get for doing his before my morning coffee! Several cups of coffee and a 75 km rather cool bike ride later, I am in better shape to assess!

Indeed you are right about the CW-75/SP-75/P-75’s – AC-4 type 6-32 stud, rubber tipped feet. What was I looking at? The bottom plates do have Phillips round head sheet metal screws. I did not pull any but think you are right about them being the blunt type.

My R-7, very late, almost R-7A, has common slots on the cabinet and Phillips head on the sheet metal screws for the bottom plate.

The MN-75 is the same – combination of both head styles.

All MS-7/WH-7/CS-7’s, and there are 3 of each, have common slots on the cabinet screws.

The RV-75, which is a slightly deeper box than the MS-7 style, has Phillips head screws in all locations. I don’t currently own an RV-7.

So I think Garey is right....again...Drake probably used whatever was handy at the time. So I guess if you can get either type Dieter, you’re good to go, at least for the cabinet screws. If you cannot find the #4 type B sheet metal screws, let me know and I’ll see what I can do from here.

73 all – don’t you love this stuff???!!!!

Subject: Re: [DrakeRadio] TR7 Screws

Interesting. My single-owner R-7A has Philips head screws, and I am sure that the original owner was never inside it. Both of my TR-7s in the 3xxx serial range) have Philips, as well as the other TR-7s I have seen. My SP-75 has the Philips sheet metal screws and AC-4 "feet". As does the CS-7 indoor box that I have. Counted in is an MS-7 with Philips machine screws that I believe also was single-owner. However, the RV-7 that I use has slotted screws. I'm not going to take the other RV-7 out of the box to look at it. So it appears that Philips head are also "true" Drake.

To complete my earlier answer, both screws measure at 1/4 inch in length. The sheet metal screws appear to be "Type B" (blunt) screws, but I have not confirmed this by physical comparison to known samples as of yet. Pointy screws would probably work OK, but there may be a slight difference in the pitch of the thread.

As Geoff has stated, you can easily run the SPR-4 off an outboard DC supply and that is a very suitable option. There is one pin on the 5 pin socket that has TWO orangey-red/white wires attached to it. Unsolder those and move them to a new DC connector of your choice mounted in one of the spare holes on the rear panel. Use that as the +ve lead with chassis ground to the -ve lead.

Just one caution – do NOT connect an original “plugged in” AC line cord when you are using an external DC supply, unless you want to see some fireworks. The original Drake-supplied DC cord was OK as it had internal connections that prevented the fireworks and forced the removal of the AC line cord.

I am pretty sure you will lose the ON/OFF capability of the front panel switch with the DC connected externally to those two wires. I don’t have a schematic in front of me to be 100% sure. The nice thing about using the external supply is you avoid any potential problems with the internal AC supply. A 1 amp/12VDC wall wart should work ok as long as it is a well-filtered variety. Some are pretty “buzzy”!

There was a lot of discussion on this group about SPR-4's and their
PTO's and dial mechanisms.

What I would do first is to see if the dial moves freely or not (do not
force it, it is not "just stiff" if it does not), and then open the unit
to determine which PTO and dial assembly it has.

I would also look at the blue lenses to see how blue they are and which
light bulbs work. There are three options, one is to replace them all
with #47 bulbs. The second is to replace them with longer lasting bulbs
(which I think are slightly redder) and the third is to replace them

with LEDs. There are lots of places that sell drop in 6v bayonet light bulbs with LEDs in them. I got mine from superbrightleds.com, but there is also cointaker and the 2b parts has them now too. My advice to you is unless you really want to be as close to factory fresh as possible, replace the S meter and tuning dial bulbs with blue LEDs and the center bulb with a long lasting incandescent one. You may also get an unusual, but useful look replacing the center one with a red LED, I don't know.

Don't expect it to be what it is not. It is really designed for casual listening to shortwave broadcasts in the day the band was not crowded. It does receive USB/LSB and CW, but it is not as sharp as some people would like. Don't expect it to be a modern receiver with narrow filters or DSP and you will be fine. That said, with a good speaker or headphones, it makes a great receiver for listening to moderately strong shortwave broadcasts.

The factory unit did NOT come with the ham bands, and while it works on the ham bands with the right crystals, I don't recommend buying them for it if they are not already in it.

In contrast to Peter, I do NOT recommend doing anything to the power supply, or power cord. If they need work or replacement, I would run a pair of wires from the 12 volt input out one of the spare holes in the rear of the radio and power it from a 12v power supply. The radio itself uses very little power, the rating doubles with the lights on.

If you plan to use headphones, unless you have 1960's vintage headphones, make an adaptor cable with a 1/4" inch mono plug for the radio, and mini socket for your headphones. Put a resistor (40-60 Ohms) in series with the "hot lead".

Geoff.

I feel your pain. I had the same thing happen with my CE-100V today while thinking I?d put it on the air paired up with my ?new? R-4B. It was working fine when I put it in the back room a couple of years ago.

I decided to put it aside until next week and enjoy my weekend instead. I can?t get my head around the schematic and voltage charts on such a nice day, and figure it?s not good to work on a radio when you?re angry with it :)

What you did was to get up in the morning. Can't help
with the R4 but the TR-4 may yield up to a careful
inspection. If you don't see anything visually use your
nose. It could be a cap, they often poop out with a puff of
smoke. Other less easy to find or fix things can happen too
but check for puffed up caps or burned looking resistors.
Note that resistors do not always burn up, they can just
split so poke at the wiring while inpecting it. A chopstick
works fine for this.
Now, if this was something modern you could send it to
the factory or just toss it because no one can fix that
stuff, but, with a little struggle, the TR-4 will be back
like new.

Doug -

The key is to move 'between channels' now. We have apparently become a channelized service now
with all the digital readouts, etc. Seems 'we' only make contacts on even 5's or 10's of kHz.
And then spend time arguing about who's off (or on!) frequency.....

I doubt the GUF-1 would do much good, since it's still 8 kHz wide. It's just if you can get them a few kHz away, they'll drop off in level faster... :-)

Sorta..... The TR-4 jobs went all the way around, but were open on the end. These were more 'tin-plate' thickness, rounded off over the end of the bulb and didn't go quite all the way around the tubular part. Left 20 - 30% of the tubular part clear, so you could rotate it around
to direct the light on the dial.

>>
>>
>> The question I have is has anyone attempted to make any type of light reflector to get the lighting to disperse more evenly on the VFO or meter lighting. All of my 4 line stuff has a "Hot Spot" where the bulb sits and then the lighting gets lighter on the VFO window as you move away from that spot. As expected, there is quite a bit of "Wasted" light that lights up the inside of the rig. I wondered if someone had improved the factory reflector the bulb socket mounts to.

Garey and the group.

I made it three for three last night.

I have a solid state audio amplifier I use for signal tracing.

The TR-4 had a burnt resistor in the AGC circuit so I replaced it.

There is still no TX, the relays won't pull in.

I can 'see' the calibrator on the meter, but no audio (let me clear that a bit. If I turn the audio all the way up, i can barely heard it out of the speaker.)

So i decided that I'l probe the input and output of the 6AQ5.

Using a capacitor to block the DC, I touched the plate. For an instant I heard the calibrator and then all the smoke went out of the audio amplifier tracer unit.

I shut everything down and went to bed.

Mike -

Just remember.......

'We do this for fun...' 'We do this for fun...' 'We do this for ....' :-)

The low level audio stages run off of the same 17.5 V bus from the 10k resistor.

Check the DC on the 6AQ5A... We seem to be running into a spate of Output Transformer failures
lately. They must be nearing the end of the warranty period!!

Watch that switch on the left side of the TR-4C. If not blocked, it's easy to hit when hauling
the transceiver around. What resistor burnt??

I think you made the right decision for the time!!!!!!! :-)

We do this for fun.... we do this for fun...

i'll keep trying to remember that...

The switch on the side has been disabled. It broke years ago and someone wired it direct.

The audio , or lack of, is in the TR-4.

What are the collectors of these things doing for replacement audio transformers?

I'll throw a scope on the plate, when I feel I got the nerve to do so today, and see if there is audio there. If so, then I guess the transformer is kaput.

would the audio problem cause the relays to fail to pull in?

Take your scope and look at the audio output _grid_
never mind the plate, in fact you can pull the tube out.
Are you getting anything at the grid. If not you can work
back to the source, if you are then check the plate circuit.
First thing is to make sure the switch on the headphone jack
is working, do you hear audio with phones? I think you
said the speaker thumped when AC was applied so this is
probably not what is happening. Check to see if the output
transformer is open, if it thumps its probably not. Check
the capacitor that feeds the anti-vox, C-142. If its shorted
it will put DC in places its not wanted and could explain if
the VOX and keying doesn't work. I don't remember if it was
the TR-4 or R4A that smoked. If its this rig I repeat my
advice to inspect very carefully for anything burned or for
a burned smell. Its been a while but the odors tend to hang
```

around.
If you have an audio oscillator you can test the
output transformer with the set off, remove the output tube
and put the oscillator on the plate lead, it should be
audible.
I can't explain your signal tracing amp except that
you must have used a capacitor that shorted as soon as some
DC got on it. Use the scope and see what you find. I don't
think its the transformer although its always a possibility.

Mike -

No, probably not. You don't need a scope, just measure the DC on the 6AQ5A.

The Bogen T725 'Universal' transformer is a decent replacement, assuming a donor unit isn't available. Of course the donor unit may have the same 'warranty' expiration! :-)

What was the burned resistor??

I had my TR-4 stashed on a shelf on its side for a
while. When I took out again I found the switch had broken.
It sticks out enough so don't put the thing on its side. I
was able to get an exact replacement from the local Radio
Shack.
I saw most of this thread at work where I really could
not follow it and am trying to catch up. The same fellow
had a problem with an R4A. I thought the resistor Garrey
asked about was in that. Finding where it is should be a
major clue as to what has happened.

Dayton Audio DMPC-60 60uF 250V Polypropylene Capacitor
Brand: Dayton Audio http://www.parts-express.com/brand/dayton-audio/301
| Model: DMPC-60

Overview
Make the Dayton Audio line of metallized polypropylene capacitors your standard choice for all of your loudspeaker projects! The same high quality as the competing brands ... but at a much lower price. They are suitable for a wide range of applications.

Highlights
250 VDC rating 5% tolerance High purity High current capacity Specially designed for crossovers Dimensions: 40 mm x 77 mm

Part # 027-4

Dave -

Should work fine, but where you gonna put it???? Have you checked with Tom at Hayseedhamfest.com?? He offers a drop-in replacement.

Plus, it's generally not a good idea to replace only part of a multisection cap. If one part is
bad, the other is typically not far behind.

Hi Garey and thanks again for your help!!!!

Well finding the 10uf at 25v is not to much of a problem. Were am I going to put it is a very good question lol... I'm thinking of soldering the ground wire to the underside of the chassis were the old can ground wire was and bring the cap up threw the hole and cover the positive end with tubing and back down to the connecting wire. Don't really now until I get it in my hands lol.

Yeah I ordered a new can from Tom unfortunately he is having problems with venders and tooling for his cans. Don't know when they will be back in stock he is working hard to resolve this so I'm hoping that my fix will be temporary until Tom has them back in stock. What a nice man and great support he gives :)

I cant get much S meter indication on 10 meters after alignment. The calibrator is strong on the other bands but Im seeing S2-S4 on the 10 meter portions. Heres the strange thing, if I slide the RCVR/TCVR from tcvr to rcvr the reading jumps from S2 up to S8. The switch doesnt have this effect on the other bands.

Electrolytics are so much smaller nowadays: I haven't had any problem squeezing a 68 uF @ 250V or so under the chassis, and, of course, a 10 uF @ 25V is not much bigger than a 1/2W resistor...

Try temporarily bypassing the switch with a jumper.

The calibrator does lose steam on the higher bands. A better test of sensitivity is to put a 50 uV signal in via the antenna connector and look at the S-meter reading. It should be around S9.

I just replaced the 60 mfd with a 47 uF 350V cap a few days ago (and also the other little 10 uF cap) and tied them under the chassis. Plenty of room. I assumed 47 uF would work as well at 60 uF for this (it IS within 20%, after all).

David -

OK. When you switch to RCVR, you are disconnecting the 'safety' RFC to ground from the TR-4C
receiver input. You're also disconnecting whatever load is connected to the transceiver ANT jack from the receiver input. I suspect if you put a signal generator on the ANT input, you'll
find that the TR-4C receiver is just fine.

Have you listened to signals on 10M?? Compared s/n with another receiver??

I can't get too excited until you put a KNOWN signal level on the input so we only have to worry
about the receiver sensitivity and NOT what the Calibrator efficiency might be..... I assume
you've swapped the tube in the Calibrator?

That would be R168, part of the S-Meter bridge, supplies B+ to the (!) 6AQ5A.

Have you measured the DC voltages on the 6AQ5A YET????

Be interested how that works out..... this is the power supply decoupling for the low level
mic stages, and controls the amount of 'backwave' you might hear on your SIDETONE. Might also
upset the VOX for CW???

Hi all
I roger too. That switch keeps toggling back and forth when moving the rig from one place to the other and not "locking" it with that slug I still have nearby!
When that switch is set to TCVR, the RX went up like magic.
That receiver is very very sensitive and worth fitting. Got in ZL3XDJ cw last night like a little bell, almost no noise. Great- If I could only emitt beyond qrp! (And my O1 is kaputt as well on the TX side , waiting to get repaired)
I think the quality of the TR4 receiver part (w. some documented vy minor mods) - yes compared to my O1- is worth my effort fixing now the transmitter part of my great sounding idle TR4.
BTW: While I run only QRP w. it , and only on 40 and 20M it would do , I discovering the fun of reach with only 5 watts .
But with all PA 3 finals in there which wouldn't give more for now, even after changing them, I want now to bring the emitter up to nominal.
To start with here is a first symptom :
When I try to set the (negative) bias voltage on my (Heath-) refurbished AC4R PS
as soon as idle plate current reaches the idle current recommended of .1A, the TX relay jumps into ON state.
After sorting that out (measuring the -60V, etc..), etc..
Where should I continue with:
- realign , balance, neutralizing PA
- check voltages and HF levels on drivers, etc..

Later on : I want to reduce the pitch also to say 500Hz. How many capacitors in the RC - phase-shift oscillator t.b. changed (all 3?)- Values half their nominal value?(as 1/RC would call for)..

Finally, going back to the receiver part, I have an left unused 9000.75 kHz 8 - pole CW filter from my Orion1 I want to insert/switch in w. relays in lieu of the USB/LSB former "can " in CW. As the CW signal passes the upper side of 9 mHz I reckon that filter should do it. Only thing left is impedance matching: The " can" is fed with coax terminated on both ends w. 450 Ohms resistor . So I infer that that is abt the I/O impedance. My O1 has 50 Ohms I/O. Hence I think a matching w. a broad band 1/9 unun should do the trick. Right?
.. .
Any thoughts on this would be vy welcome.
Thank you vy much for now.

Garey, I "guess" it worked out fine. If you remember, I was hearing the backwave CONTINUOUSLY while the T/R relay was on Transmit (even between dots and dashes). Replaced with the 47 uF cap, all that backwave went away. I DID find last night that my VOX DELAY settings seemed to have shifted a bit, but a little re-adjustment and all good. I thought values plus/minus 20% were fine for replacements?

Hello Pierre -

I'm not sure I understand your BIAS setting problem.... The relay must ALREADY be pulled in to
set the IDLE current. There should be NO IDLE current until the relay pulls in.

The '80 and 20M only' problem is related to the BAND (crystal) oscillator. Is this on both receive and transmit, or just one? V1, V3 and V4 are the stages involved in operation on 'other' bands.

There are eight different versions of the TR-4, and various filter impedances are used. Early
ones are 2k, later ones are 470 ohm impedance. Check R16 and R77, they are the filter in and
out impedance.

Certainly a CwRIT would be simpler! :-) The RIT is certainly helpful on CW, and makes the TR-4C at least 'usable' on CW. The B or C-Line twins would be a better choice for CW operation
if you change rigs......

Paul -

I thought I remembered that! :-) Electrolytics were always +/- 20% at best. Early 60's they were still mostly +80/-20%. The question here is whether 47 uF is 'enough' decoupling between
those stages. 'Backwave' on the SIDETONE is a common result of high ESR or low capacitance in
this cap. The basic problem, aside from power supply ripple, is the audio tone being coupled
'around' D8, which is what 'keys' the SIDETONE. Since the SIDETONE is what holds the VOX 'in'
between code elements, if only a little SIDETONE 'leaks' around it may get to the VOX amp and
cause the relay to hold in a little longer.

Otherwise, 47 uF is ok. Perhaps 60 uF was a 'minimal' choice, since most caps were out of spec
on the high side!

Probably dipped in clear lacquer. Any stripper you use will take of the black printing as well.. You could spray it with Krylon Clear, 'matte' finish or 'flat'. It wasn't shiny to begin with.

20285. K1 relay & board install on TR-4(31355)

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-22 03:28:34 UTC
From: James Scribner
Topic: 20285 Message: 20285

Hello to the Group,

Installed the K1 board in order to install plugin relay and notice there is not a provision for RFC 8 at C90. Would it be acceptable to mount it beneath chassis at C90 in *series* with 4 other connects there already? I am assuming the choke was necessary in first place so would like to reinstall in a back functional manner.

Secondly the relay pull-in coil is only 2.5Kohm. From what I researched here on the Group, it seems it is need of more resistance. Would another 2.5Kohm in series at C92 (again on bottom of chassis) be an appropriate fix as far as *resistance* and *location*?

Have board installed and spent hours ohmming it out w/spare relay. looks at this point to be a good replacement except the instruction need a bit more polish which I hope to attain here.
Thanks in advance and hope everyone had a great Easter.
W5SWM
Jim

Paul,

Buff it off with the finest steel wool you can get. This way you will remove the old clear coat and polish the metal at the same time. When you go to clear coat it there will be no chemical residue to remove, just finger print oil and dust.

Paul.
4-ought steel wool would be OK, then polish off with either 400 grit wet-dry emery-cloth of one of those green & yellow plastic-nylon sponges with a tiny bit of toothpast. Or, of you have a Dremel tool, you could try a soft buffing wheel at low-speed with a bit of jewler's rouge. Good luck, keep us posted.

Subject: Re: [DrakeRadio] Removing "finish" from T4XC bezel/skirt?

Put the danged-thing in paint stripper this morning for 30 minutes... NOTHIN removed! Maybe it is NOT some sort of lacquer. Last night I used lacquer thinner, also did nothing. I don't want to scratch the thing too much, could one use 0000 steel wool and then "sand" smooth with fine sandpaper? There are no numbers on this, just the silver skirt.

Paul,

Most likely you will want to polish the metal when you remove the clear coat. I use the finest steel wool I can get and buff the clear coat off and then polish the metal. You could use aluminum polish, steel polish or just about anything you want. I use steel wool only then there is no residue in the metal when it is recoated with clear coat.

From: Garey Barrell
Topic: 20293 Message: 20293

Jeff at Harbach Electronics has announced a couple of new Drake products!

Harbach Electronics Home Page Press Release

*19 April 2014: In response to customer requests, I am now pleased to announce availability of
2 new kits, the RA-TR4 and the RA-T4X/B. These are plug-in relay adapter kits for the Drake TR-4 and T-4X/T-4XB radios. These kits replace the old chassis-mounted T/R relay with a small
PC board and new plug-in relay. All components are included in the kits including a new relay,
socket, PC board, wire, spaghetti tubing and complete installation instructions. They are available in the Drake products section. I will also have them at Dayton.*

http://harbachelectronics.com/shop/drake/ra-tr4-plug-in-relay-adapter-kit/

http://harbachelectronics.com/shop/drake/ra-t4xb-plug-in-relay-adapter-kit/

These have been unavailable for a while now, and really make the upgrade to a plug-in relay easy
to do. We are fortunate to have people willing to supply these specialty products, and should
support them as much as we can.

Jim -

The RFC7 is there to ground the RF OUTPUT for DC (should the Plate coupling capacitor short) and
to bleed off static charges built up on the antenna due to nearby lightning and electrostatic
charges. It should be connected directly to the RF OUTPUT connector and to the frame of the LOAD capacitor or other nearby CHASSIS ground.

A series resistor _1.5k_ @ 1W should be placed in series with the relay coil. Physical location is not critical.

You could try a screw and bolt and chuck it into a drill press to steel wool it.

I have rejuvenated B--Line knobs using a drill press.

Garey
Thank you for the info on the proper resistance for the coil. Should be easy to incorporate it.

The inductor/choke in question was RFC8 not RFC7. Am familiar with the P.A. bleeder. Actually broken off when I received radio and used it that way for a week. The RFC8 is the one I was asking about as in would go between C90 and the Pin7 on new relay. Looks to me like open on Rec and grounded thru Pin6 (new relay) on Transmit.

Jim -

RFC8 is no longer used. They don't make that very clear in the instructions! :-)

That is the XMTR CATH line, that grounds the Cathode circuits of the Xmit, Xmit Mixer, Driver
and PA stages in transmit. I think there just wasn't any way to get it in there physically. It's only 'hot' when the transmitter keyed, and is grounded by the relay so apparently not a
problem There is a very short PC trace between C90 and the relay socket. Save it for another
use! :-)

20301. test socket during alignment

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-22 21:32:29 UTC
From: David Nichols
Topic: 20301 Message: 20301

SO I MADE UP AN ALIGNMENT LOAD AND SET TO DOING A PROPER ALIGNMENT ON THE TR-4CW. IM ON THE INJECTION COUPLER SECTION AND I DONT REALLY LIKE STICKING MY FINGERS IN THERE TO ATTACH MY TEST HOOK TO THE TUBE PIN. MY FIRST GO AT IT I JUST TURNED THE RIG OFF AND MADE THE ATTACHMENT TO PIN 9 OF V3. I MADE THE ADJUSTMENT AND WENT TO SEE IF IT WAS SET BY CHECKING MY WORK. BUT I THOUGHT WHY SHOULD I PUT MY FINGERS IN THERE? I HAVE TEST SOCKETS AND CAN USE THEM TO ATTACH MY LOAD. SO I INSERTED THE TEST SOCKET AND ATTACHED THE LOAD TO PIN 9 AND TURNED THE RIG ON. IT WENT DARK, I FOUND THE WIRE FUSE BURNED IN HALF. I CHECKED THE TUBES, FOUND A SHORTED PIN TWO ON THE DRIVER V6 AND CHANGED IT OUT. I HAVE SINCE BURNED THREE MORE FUSES. I WILL START CHECKING RESISTANCE READINGS AND TRYING TO FIGURE OUT WHAT IS DOING THIS. I GUESS THAT USING A TEST SOCKET ISNT THE WAY TO DO THE ALIGNMENT. I THINK I WOULD PREFER TO KEEP MY FINGERS OUT OF ALL THE WIRES AND PARTS. MAYBE I
NEED TO GET A LONGER HOOK FOR MY TEST LEAD. SO DID THE TEST SOCKET CAUSE THIS OR DID I JUST ROLL SOMETHING AROUND AND MAKE A SHORT?

DAVID, KX7C

David,

I'm sure you already know this but I figured I'd throw it in anyway.

You can blow this fuse by shorting the bulb socket as well. I had the socket loose and it shorted to something on the bench.

You should see at least 150-200 V p-p into what is essentially an open circuit. Actually it's
about 30 k or so via the BIAS supply, so probably a watt or two in 'losses'. There should be NO
'power' involved as the PA is in AB1, with ALC to throttle back the drive if ANY Grid current
(power) is drawn.

BE CAREFUL if you are using a scope. Most probes will not handle that sort of AC voltage!! Just holding the probe in the general area of the PA Grid should give you PLENTY of signal on a
scope.

Thanks for the suggestions, I had not checked the bulbs but have now. I have not found the problem but I have checked about everything but the problem. Since I was doing the alignment I know exactly which tube I was on at the time. Whatever it is, is making very good contact. Im using my continuity meter as I go along with one side on the fuse and the other to ground. I figure if I do break the contact it will shut the meter up.. So far it looks like I better get some new batteries ready for the meter. I bought this TR-4cw to play with but this aint the playing I had in mind. I have an R-4B coming in tomorrow and wanted to get to checking it out. Maybe I will, I might need to give this TR-4cw a rest.

I think this is likely oxidation of whatever material
the dial is plated with. I don't think any kind of solvent
will take it off. The first thing to try is tooth paste.
Toothpaste is a mild abrasive and will clean all sorts of
things without taking much metal off. Next stronger is a
polish with a mild reducing agent in it. I used Barkeeper's
Friend or Zud, which are identical. These have a little
oxalic acid in them. I find they are milder and more
controllable than Naval Jelly. Another similar chemical
reducer is Tarn-X. All of these must be used a little at a
time. See what they do and use the toothpaste to take off
any residue they leave.

20313. TR-4C - Alignment Questions

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-23 12:19:04 UTC
From: Steve VK2SJA
Topic: 20138 Message: 20313

Hi Garey/All,

Well I'm back from vacation with a couple of days off work. So I'm looking forward to finalizing the alignment of my TR-4C and hopefully getting her on air. Spent today modifying a home-brew wet dummy load (Canteena) to give it power measurment capability so I can accurately measure high power for the first time.

I also installed a 47uF electrolytic capacitor across the back of the plate meter. This has tamed the meter ping-pong bounce. But the smallest voltage rating I could find was 25 volts. Is this going to be a problem long term? Should I try and source a 10v or 16v one?

After installing this cap the plate meter at idle was reading significantly lower than before. It was a tiny fraction high before but I just noted this and left R13a alone. I must profess that I don't understand why it would read low. If anything I would have thought the cap would make it read somewhat higher? Anyway, I then verified 100mA across R45. Then I replaced R13a (was 33 ohms from memory) with a 100 ohm multi-turn PCB pot. This allowed me to set the meter correctly so that it reads bang on .1 for 100mA. Tested meter in tune-up and all appears normal. Question: Is there any reason why I shouldn't just leave the pot in place?

Oh, and I also wired up and tested a microphone. So I feel like I'm on the home straight at last.

But I have yet more questions. As I'm thinking it might be best to re-do all the alignments now that the "faults" have been corrected.

Q1. Alignment procedure starts with the disconnect of the plate and screen supplies so as to essentially disable the final P.A. section. I now understand that this is required so the the final tank circuit resonance (or non-resonance more likely) does not impact the reciever alignments. How critical is this? And which specific alignments are affected? I can't imagine that the crystal calibrator or the 9Mhz oscillator would be impacted by tank resonance?

Q2. In alignment steps 5-16 "Mixer and RF Alignment". Where you adjust for "maximum plate current" is it acceptable to adjust instead for "maximum RF power out on an external watt meter"? Or are they in fact two different things?

Q3. I think somebody else was recently talking about this same issue on a TR-4X but I don't know if there was any resolution. My S-Meter drives into negative territory during the valve warm-up period. i.e. during this period the voltage across this meter is reverse polarity for a period.

Round about the time that you get RX audio heard in the speaker it would pop back up to S1 and from then on behave normally. I'm not sure if this behaviour should be considered a "fault" or not? It never bothered me before but after physically moving the meters and installing the cap on the Plate meter today the S-Meter has started "sticking" in the maximum negative travel position. Such that I need to use the S-Meter Zero adjustment control to drive it hard into positive territory to un-stick the movement and the adjust it back down to S1 again. Trivial but most annoying. So is the initial reverse voltage condition during warm-up a fault needing correction? Can I just add a diode into the S-Meter circuit right at the meter so that it can only see forward voltages? If so what sort of diode and ratings?

Thanks again in advance (to everyone but especially Garey).

I'm getting very close now!

73, Steve

This appears to be a failure mode of the meter. I have wondered whether the manufacturer put
some sort of silicone grease or other on the bearings to damp this motion. MOST do NOT exhibit
this characteristic, and I would think that high temperatures and hours of use could affect it,
but it might be just another manufacturing variation. The 'cheap' meters with 'vane' type movements were always jerky, (see early Heathkit and WRL transmitters!,) and 'moving coil' meters were more 'sedate'..... The meter only sees millivolts, so really not significant whether the cap is 10 or 25V rated. Dielectric formation 'could' be a problem with either, but
I'm not aware of any 1V rated electrolytic caps!

I suspect that the lower reading is leakage in the cap. (Possibly as a result of dielectric 'non-formation?) Your 33 ohms is about right for R13A. Typical values here are in the 20 - 60
ohm range. The meter is actually a voltmeter, measuring the voltage developed across R45. With
a 2 ohm R45, 600 mA develops 1.2 V. So we need a 1.2V DC full scale meter. The basic meter is
5 mA full scale with an internal resistance of 200 ohms. 1.2 V across 200 ohms is 6 mA, so we
need a series resistor of about 40 ohms. The meter internal resistance varies slightly, therefore the need for selection. Nothing wrong with a trim-pot, as long as it isn't subject to
inadvertent bumps.

We're not worried about alignment impacts as much as having the PA sitting at non-resonance while you are twiddling transformer adjustments. The PA is really a 'sub-assembly' and the entire radio would work just fine if you removed the PA and made the Driver the (QRP) transmitter. So you can work on / adjust the entire radio with the PA disabled. I'm not sure
why Drake specified removing Screen AND Plate voltages. Removing ONLY the Screen voltage to the
PA essentially disables it completely. That's all I do. The Pi-Net DOES affect the receiver,
it's basically a bandpass filter at the front end of the receiver, so both PLATE and LOAD controls should be adjusted for maximum signal when receiver tests involve the ANTENNA input.

For this purpose they are the same. IF the PA neutralization is not correct the two will not be

at the same point, but for alignment you are only looking for the peak, so either works fine. I
prefer to work with a scope on the Grids of the PA for these adjustments, with the PA disabled
as above.

Just out of curiosity, do you have a 6AQ5 or a 6AQ5A tube at V17. The 'reverse S-Meter' problem
is the result of the bridge currents being unequal during warmup. If V4, V11 and V15 draw their
expected current BEFORE V17, the meter will deflect negative. Conversely, if V17 reaches its
current first, the meter will read positive. Most small receiving tube are designed to reach
operating temperature in ~11 seconds. This is a holdover from series filament strings in TV
sets with 25 tubes in them. Since the series resistance goes UP as they heat, if one or more is
slower or faster than the others, the voltage distribution of the string is disrupted. This
prevents some tube(s) receiving excessive filament voltage and various HV supplies wandering all
over everywhere as each tube draws its design current. The "A" at the end of most small
receiving tubes means that it meets the ~11 second warm-up specification. But I digress!!
:-) Anything that slows V17 reaching it's steady-state design current will cause the meter to
go negative. It could be as simple as a 'non-A' tube at V17, or a filament pin in the tube
socket, or C135 with a high ESR, or ....

It has to be a short from the filament 'hot' line to the chassis. The fuse is in the 'hot' side
as well, so all those parallel tube heaters to ground are going to read a very low resistance to
ground, and your continuity tester may not be able to tell the difference. Have you pulled the
'adapter'?? They can develop internal shorts. Something is connecting the filament line to chassis with essentially zero ohms.

Pin 2 of V6 is the Grid, not this problem. Pins 4 & 5 of V6 are grounded, Pin 6 is 'hot'.

V3 filament pins are 4 & 5, one should be grounded, the other 'hot'.

> Thanks for the suggestions, I had not checked the bulbs but have now. I have not found the problem but I have checked about everything but the problem. Since I was doing the alignment I know exactly which tube I was on at the time. Whatever it is, is making very good contact. Im using my continuity meter as I go along with one side on the fuse and the other to ground. I figure if I do break the contact it will shut the meter up.. So far it looks like I better get some new batteries ready for the meter. I bought this TR-4cw to play with but this aint the playing I had in mind. I have an R-4B coming in tomorrow and wanted to get to checking it out. Maybe I will, I might need to give this TR-4cw a rest.

Thank you, Gary. I was able to order some replacement tubes from one of the links you sent me. It was the 12AV6, Now I have full side tone and tuning capability I hadn't had before. Now I need to do some alignment with the carrier balance, running too much plate current. I have the manual and I'll follow the instructions as soon as I get the time.
Dayton Hamvention is coming up so I would like to get the radio going and get it off the workbench, 'cause I never know what "treasures" I may bring home!

20317. Setting 70 mA bias for T4XB

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-23 17:45:16 UTC
From: <rochep@...>
Topic: 20317 Message: 20317

I know we are supposed to set our no-load bias to 70 mA, but my meter does NOT read ZERO mA when powered off, it is sitting up at about 20 mA. Should I therefore adjust my bias to 90 mA (taking the 20 mA as a "zero", or not worry about it? I don't see how to adjust the meter to zero (like I can in my R4A receiver).

Paul -

Have you 'calibrated' your PLATE meter at 70 mA?? If so, you can just set it to 70 mA. If you
haven't, you should. That is the most critical meter setting in the T-4X(any).

There have been a couple of threads regarding zero'ing these meters that you might want to look
up. I think one guy just found a spot where he could glue on a small magnet to zero his meter.
I'm not sure that's 'kosher' since it will no doubt affect the linearity of the meter. But all
things considered, the meter is really only critical for setting the 70 mA current. The rest of
the scale is primarily used to indicate resonant dip, and the absolute value isn't very critical.

As an aside, I have seen cases where the meter bracket becomes magnetized, and demagnetizing it
can restore a meter to normal. You do NOT however want to get anywhere near the meter with any
demag tools!!! Sometime you can just smack the bracket with a hammer, (after removing it from
the radio!!!!!,) to demag it.

Simplest is to measure the resistance of R45 with the DMM, and then calculate the voltage across
that resistance for 0.07A.

OOps! Too many projects going at one time..... Measure resistance of R35, then measure the voltage across that resistance for 0.07A. Once set for 70 mA, select a resistor for R38* that
makes the PLATE meter read 70 mA.. Be sure and select R38 with the transmitter right side up.
It does make a difference.

I will do this, but wouldn't using a DMM INSTEAD of the meter to adjust the bias give me an accurate bias current AND tell me what "70 mA" reads on the T4XB meter? (Don't worry, I will measure the resistors as you said!).

Yes, you can do that. You need to measure Cathode current, so need to 'break' the PA ground to
insert your meter.

My way is just a couple of readings on the DMM and a little 'higher' math with Ohm's Opinion!

I'm not concerned about parallel resistance, but the test leads on your DMM have 'some' resistance. Depending upon the leads, they may have a tenth or two ohms resistance between them. If you short the probes together, what does the DMM say? (Beside, 'Don't short me!!')

OK, IM GOING TO WEAR THE NOISE BLANKER OUT PULLING AND RE-INSTALLING.

JUST WANT TO CHECK AND SEE IF IM SEEING THINGS RIGHT ON JUMPERS FOR THE SOCKET. IT LOOKS LIKE PINS 1+7 AND 2+6 THE WAY IM SEEING IT.

I HAVE TRACKED MY SHORT DOWN TO EITHER THE SSB SWITCH OR THE SSB LIGHTS?

IM PUTTING EVERYTHING ELSE BACK TOGETHER UP TO THAT ISOLATION POINT TO SEE IF THATS THE ONLY ONE. THAT SWITCH IS GOING TO BE TOUGH TO EVEN GET AN EYE ON. AT THIS POINT, IT SEEMS TO SHORT WHEN I INSTALL A BULB IN THE HOLDER. I DONT UNDERSTAND EVERYTHING I KNOW ABOUT IT YET. HI HI

So here is where I am. I found R36 (it is on the board right behind the power resistors near the relay). I measured 3.3 ohms NET (background of meter was 0.1 ohm), so it is all OK. At 70 mA the voltage drop should be 0.23 volts. On TUNE I measure 245 mV one side and 10 mV on the other side, this is about 235 mV drop. I am happy with this. My METER is reading about 0.02 amp turned off/on SSB and then on TUNE my "70 mA" reading is about 0.1 amp on the meter. (0.1-0.02=0.8 amps anyway, so not TOO bad just by going "up" from 0.02).

R36 is my "calibration" resistor located on top of the meter switch; this has no value listed on the schematic (with the manual). The resistor is MARKED 27 ohms but I measure 36 ohms when out of circuit. So this is the resistor I have to change to get my meter to read "0.07 amps" when it is REALLY 0.07 amps? I do not have a 0-100 ohm or 0-250 ohm pot to figure out the best value. Instead of goofing around I will get one at RatShack tomorrow and do this right.

Thanks for the help!!! I knew bias was important but I guess I did not realize the meter could be that far off.

paul

Do you have a 400 or 500 mA fs meter?? Early ones had 400 mA, later ones had 500 mA.

I think you're going to need a 2.7 ohm resistor, the 2.2 doesn't develop quite enough voltage
for the meter. The T-4XC actually went to 3.3 ohms for a little more margin.

Exactly.... This is why checking this is so important. The idle current has a LOT to do with
linearity AND dissipation in the PA tubes. Can make a big difference.

Paul -

I still haven't learned to read all the way down my eMail before answering!! You came up with
the correct answer in spite of my "help"! :-)

Yes, R38 is the resistor mounted on the slide switch terminals between PLATE and LOAD controls.
This is a 'select at test' resistor to calibrate the meter.

Don't worry about the 'offset' of the meter at 'zero'. Just choose R38 so the meter reads 0.070
mA (the mark 'above' the scale) when you have 230 mV across R36.

I think it was Steve who was experimenting with zero'ing meters.

Topic: 20317 Message: 20334

Wow, I had to change the calibration resistor R38⋆ to 320 ohms to get the meter to read 0.07 when the voltage drop across R36 is 230 mV. Now at least I can be sure where "70 mA" is on my meter. Unfortunately, the other readings are way off: For example putting 130 watts OUTPUT (measured on my wattmeter) the plate current on the T4XB read 0.25 amps. WHOA!! That is (theoretically) 162 watts INPUT power! I knew the transmitter was good, but I don't think it is 80% efficient!! Assuming 50% efficiency, that means that the 0.25 amp reading on the T4XB meter is REALLY 0.4 amps. Am I doing this math right?

I really don't use the T4XB meter when tuning up, I use my wattmeter and go for maximum smoke and then turn gain back to about 100 watts out.

I have to go back now and "calibrate" my T4XC to confirm 70 mA bias.

I know that in addition to getting new blue filters we are all told that re-painting the VFO "hood/reflector/light shield" pure white will really help. I did not think mine looked THAT yellow, but re-painted it with pure white primer paint (all I had). WOW, what a difference!! Even with the faded blue filter the panel looked MUCH more "blue" and less "greenish blue"!! I can't wait for my new Lee Lagoon blue filter.

I thought my VFO hood/reflector think already WAS white, I was wrong. If you have not done this, I think you will be amazed.

Ok, its alive again! I found the short to be the filter mounting bracket shorted to one of the solder lugs on the filter switch. Wish I had started at the front. hi hi I have learned a lot more about the TR-4CW than I believed I would when I bought it. I hope it doesnt turn out to be related to a Ford. hi hi Well the good thing is you can work on them.
With all the rolling and turning, getting to the top and then the bottom I suppose I used the filters as a handle or something. As far as the shorted tube, it seems to be intermittent. It tests out as a very good tube if you dont change its position, what a shame.

Now, what was I doing?

It has to be a short from the filament 'hot' line to the chassis. The fuse is in the 'hot' side
as well, so all those parallel tube heaters to ground are going to read a very low resistance to
ground, and your continuity tester may not be able to tell the difference. Have you pulled the
'adapter'?? They can develop internal shorts. Something is connecting the filament line to chassis with essentially zero ohms.

Pin 2 of V6 is the Grid, not this problem. Pins 4 & 5 of V6 are grounded, Pin 6 is 'hot'.

V3 filament pins are 4 & 5, one should be grounded, the other 'hot'.

Cool! Those socket terminals are a PITA..... They just rotate too freely, and of course end
up leaning up against ground!

The fuse wire is #26 copper. The best source for this is a #18 AC line cord, which just happens
to consist of 7 strands of #26 ga copper wire!

Please do not replace it with any other wire, it is VERY important to protect the wiring harness
in case of a short on the filament lead!!!!!!!!!! If this wire is too big, you can end up with
a donor radio very quickly.

I didnt dig through my shop to see if I had any cords but Ill keep that in mind if it happens again. You get a lot more fuses that way.. I used the leads off of some old caps in my parts drawer. The schematic called for #26 tinned wire. I checked for diameter of #26 awg and it is .0159 or in my book .016. My cap leads where perfect, I used two caps.. hi hi
Nooo, it wasnt my test socket that shorted. I was watching for that, it was the bracket the filters are mounted on. It got pulled forward into the filter switch or ssb switch. Touched one of the lugs on the rotary switch. There is a is a piece on the front side that almost bisects the ssb switch and is in close proximity. It didnt take much convincing to get it to touch the lug.
Happy Happy, now I am trying to figure out why it is off frequency on 40 meters, 75 meters is fine. I must have done something.

Ok, its alive again! I found the short to be the filter mounting bracket shorted to one of the solder lugs on the filter switch. Wish I had started at the front. hi hi I have learned a lot more about the TR-4CW than I believed I would when I bought it. I hope it doesnt turn out to be related to a Ford. hi hi Well the good thing is you can work on them. With all the rolling and turning, getting to the top and then the bottom I suppose I used the filters as a handle or something. As far as the shorted tube, it seems to be intermittent. It tests out as a very good tube if you dont change its position, what a shame.

Now, what was I doing?
David, KX7C

About the tube, have you cleaned its pins and the contacts in the socket? When tubes have an internal problem it usually responds to tapping the envelope. Hold the tube by the seal at the top and tap it with something. If its intermittent it will usually show up. About the pins, I have had tubes that worked in the tester or on an extender but not the socket it was supposed to go in. Cleaning the pins fixed it. Use a small wire brush on the tube and clean the socket with a pipe cleaner and Deoxit or those little wedge shaped brushes for cleaning in between your teeth. Even a toothbrush and toothpaste will work on the tube pins.

> Wow, I had to change the calibration resistor R38* to 320 ohms to get the meter to read 0.07 when the voltage drop across R36 is 230 mV. Now at least I can be sure where "70 mA" is on my meter. Unfortunately, the other readings are way off: For example putting 130 watts OUTPUT (measured on my wattmeter) the plate current on the T4XB read 0.25 amps. WHOA!! That is (theoretically) 162 watts INPUT power! I knew the transmitter was good, but I don't think it is 80% efficient!! Assuming 50% efficiency, that means that the 0.25 amp reading on the T4XB meter is REALLY 0.4 amps. Am I doing this math right?

Hello Richard, I found a longer hook I will try. That way I wont have to worry about the test socket touching a can or something. I was trying to use some little short spring loaded hooks I picked up at rat shack. Most of my stuff is packed and I didnt want to open boxes to find them. I almost have all of my boxes open now. The place isnt selling anyway. It only takes some repacking and more tape to close them up. hi hi
I found my 40 meter cal signal, all the bands are right except 40 and what I thought was off freq turns out to be two signals.. I have a weak one where it should be and 30 kc's up is a strong signal.

Stick with Sylvania, Zenith, RCA or GE for best results. Also take a ruler with you to measure
the overall height. From the bottom of the glass envelope to the top of the plate cap MUST be
3-1/8" MAXIMUM.

I'll check the meter when I get home. After soldering my 320 ohm calibration resistor in I confirmed that the voltage drop across R36 was still 230 mV; it was. The OLD calibration resistor was reading 36 ohms at the meter read 0.1 amp when it was really 70 mA. Now 70 mA reads 70 mA.

I'll go back and re-check everything tonight. I measured DC voltage on each end of R36 when in TUNE mode with GAIN, PLATE, and LOAD controls all at a minimum.

Hi Paul,
I must admit first off, that I haven't studied every msg in this thread. But I think checking the value of R36 accurately, at it's small value, is a bit "iffy". e.g. if it's supposed to be 3 ohms (or a bit more), 10% is only about 0.3 ohms, and with meter inaccuracies and lead and variable contact resistances, 10% is hard to really be sure of.
I much prefer to measure the value of each cathode resistor of the finals, and after measuring voltage drop, use ohms law to determine the actual cathode current(s). They're 15 ohms, and 10% is bigger, not so prone to error. It takes a little more time, but I think it's much more accurate a measurement.
Just my opinion and way of doing it (thru many yrs), and worth what you paid for it.
And thanks to Garey for (years ago) personally demonstrating to me the value of an ESR meter. But I'm not sure if I would rely upon it's accuracy even tho' it's meant for very low resistances.

Paul -

Yes the original is an electrolytic. A uF is a uF, whether it's electrolytic or film. The difference, as Dave found out, is that 'non-electrolytic' uF's are a heck of a lot bigger than
electrolytic uF's!! :-)

As you know, electrolytic capacitors don't particularly care for AC, since reverse polarity voltage tends to 'undo' the chemical dielectric effect on the plates of the cap. So electrolytics are used almost universally to filter or bypass DC, where they never see reverse
voltage. Film caps though, are perfectly happy with either voltage, since their dielectric is
plastic and doesn't depend on chemical action to insulate one plate from the next. Large value
film capacitors are typically used in audio speaker crossover networks, mainly in high-pass networks to keep the BASS in the big speaker(s) and the TREBLE in the tiny speaker(s).

To answer your question, no, it doesn't matter as long as you can build on an addition to the
cabinet to house the film cap!! :-)

Hi Al -

You're quite accurate, as usual..... I'm a little lazy, and with a good DMM -AND- compensating for lead resistance, you can come pretty close. Certainly measuring the individual
Cathode currents as you describe leaves less room for error, plus giving you an idea of the degree of match for your PA tubes.

T-4X and early T-4XB transmitters had a 400 mA full scale PLATE meter. They are wired as voltmeters, measuring the voltage drop across the 'sensing' resistor, which varied from 2.7 to
3.3 ohms over the years. The meter is 'basically' a 3 mA full scale device with a 430 ohm coil
resistance. So for a 400 mA scale and a 3.3 ohm resistor the meter has to see 1.32 V across R36
for full scale, which is cutting it close at 440 ohms, only a 10 ohm R38. Drake went to 2.7 ohms when they changed to 500 mA full scale, 1.35 V, which is still cutting it close at 450 ohms. For the T-4XC, they finally got it straight with a 3.3 ohm resistor and 500 mA fs, 1.65 V
for 550 ohms and a 120 ohm R38.

I would suggest using a 3.3 ohm resistor and then selecting an appropriate R38 for the T-4X(any).

Dave -

A 68 uF @ 250 VDC cap is about $1.50 at Mouser. 16 x 25 mm, radial leads. Actually anything from 60 to 100 uF@ 250 VDC would be ok.

Most all components now are on the same 'standard values' scale as resistors, e.g. 10, 11, 12,
13, 14, 15, 16, 18, 20, 22, 24, 27, 30, 33, 36, 39, 43, 47, 51, 56, 63, 68, 75, 82, 91, 100 for
5% parts.

Mike,

Reportedly the 6GJ5 will work but may require capacitance addition to the neutralization capacitor.

Hi Mike,

You already have the maximum heights allowed for those tubes from Garey, so I won't repeat what he said, save for the fact that you should still physically MEASURE your prospective candidates to ensure a good fit.

I know for a fact that Sylvania actually lists a maximum height in their tube manual for the 6JB6, so I wouldn't be particularly suspicious of that brand: they should be A-OK for you...

Yes, the 6GJ5 is a sub for the 6JB6, but like Doug said, be ready to parallel some fixed "C" with that neutralizing capacitor if you try a pair.

Dave -

That's a production change. It decreased the 'idle' output power in AM mode, probably to reduce
dissipation in the PA.

If you looked in the MISC directory of my CD, you'd find there were two versions of the T-4XB
transmitter. Drake started with 330k in the T-4X, up through the version 2 of the T-4XB, when
it was changed to 2.2M. :-)

Mike -

The 6GJ5(A) is a good sub, again sticking with the same brands. MOST will work fine, the only
difference is that the Suppressor Grid is tied to the Cathode internally whereas it is brought
out to a separate pin on the 6JB6(A). This results in an increase of 0.06 pF in Grid to Plate
and 0.5 pF in Plate to Cathode. The neut. cap only has about 5.5 pF delta C in parallel with a
10-12 pF fixed so depending upon the accuracy of the fixed cap you may need to change it.
Generally speaking, my experience has been that the four brands will neutralize just fine with
no changes.

By the way, apparently the Sylvania tubes are NOT immune to the height problem. I have had
several tell me they have seen or had them, in spite of their (and RCA by the way,) specifying
3.125" max seated height. Probably late in the game, about the time they started bringing in
the 'hand-baskets/! :-)

Hi Garey, et al,
(if anyone besides you, me, and Paul are still reading this thread)
Major point that you make, and I didn't but was thinking it, is that a "good" DMM is what we need to be using when we set bias, etc. I think there are more good ones these days %-wise than there used to be, but having a DMM that reads to 0.1 ohm or 0.01 volt, doesn't necessarily mean it's accurate to that degree.
A digital measuring device isn't necessarily an accurate device.
(and thanks, Paul, for your PM)

I recently subbed a pair of 6GJ5's for the 6JB6's in my T4XC and they neutralized easily with no additional capacitance.

I wanted to try a less expensive alternative for the 6JB6 and the 6GJ5 seems to fill the bill very well.

The only caveat, as I have mentioned in the past, is to make sure you get the shorter version of the tube...there are 6GJ5's out there that are too tall for the T4XC final cage top.

20370. TR-4CW on 10 meters

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-25 00:00:52 UTC
From: David Nichols
Topic: 20370 Message: 20370

Ok Garey I got my short figured out and did my alignment using the load this time.
I have read somewhere that I should probably see an S9 signal level on 10 meters from the calibrator.
after going through this I wonder if S7 isnt good enough.
I get a S7 from the calibrator signal on all three portions of the band.
I dont recall what generator level you guys said should give me an S9 but this is what I got.
To get an S9 reading on my S meter
@ 28.5 it took -50.7 dBm or 65.3mV
@ 29.0 it took -52.7 dBm or 57.8mV
@ 29.6 it took -51dBm or .631mV

She gave me 140 watts to the dummy load with the Bird 250 slug. My IFR only gave it 130 watts.

Im to the point that maybe I should leave well enough alone.

Anyway, I have an R4-B to play with now. Something new to shine up and check out. No, Im not going to go Marine Corps on it and whip out the Brasso. I think the deck will clean up nicely with a damp cloth on this one. Ill see what kind of trouble I can get into on this next.

20372. Re: Setting 70 mA bias for T4XB

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-25 01:19:45 UTC
From: <rochep@...>
Topic: 20317 Message: 20372

Hi boys,

I certainly was worried about the "accuracy" of my new DMM, but it read 0.0-0.1 ohm when the leads were tied together and I was able to read 2.2 ohms with my brand new 2.2 ohm resistor. So I am confident, but I certainly understand the concern!!!!

My meter is a 500 mA max meter and the resistor was 3.3 ohms (as best as I can tell ;)). So I'm shooting for 230 mA drop and I hope my calibration resistor will get it to "look" like 70 mA on the meter. Today on my dummy load with 100 watts out on 80 I measured 220 mA on the meter; this is 143 watts input or 70% efficiency. This is a bit higher than I would expect (I think the meter is reading LOW), but I think it is more important to get the 70 mA accurate on the meter.

If I stick with the 220 ohm resistor as the calibrator the 70 mA is at the 0.08 A setting on the dial. NOW all the currents are a bit high, and with 100 watts out is reads more like 240 mA or 155 watts input (about 64% efficiency). This is closer to "accurate"; maybe I will just stick with this?

paul

ps I think this discussion is great. Thanks for all your help!!

20373. 2-B passband tuning width lever removal

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-25 02:02:49 UTC
From: Ethan Blanton
Topic: 20373 Message: 20373

Hi all,

I have a 2-B with a nearly pristine face plate that I would like to remove to be able to get to the slide switches behind, because the BFO switch is a little bit dodgy. (It is very difficult to actually turn the BFO off.) However, I can't figure out how to get the lever off the pass band tuning switch! It looks like the lever itself is soldered to a push-on sleeve (maybe some sort of collet? there's a brass tube in there, too...), but I cannot pull it off with moderate force and I am afraid to exert more than moderate force as the switch and PBT board do not seem to be particularly sturdily mounted. Is there a trick to getting this thing off?

Ethan

David -

I'm going to assume you mean 65.3 'micro' (u)volts and not 'milli' (m)volts.

The 'typical' should be ~ 50 uV for and S-9. That is not a 'proof' test. The real proof test
is, 'do you get a noise peak when you adjust the RF TUNE with no antenna?' 'Does the noise level increase when you connect an antenna?' If either or both of these is true, button it up.
You have all the sensitivity you can use. There are many things that can affect this type of
test, and I wouldn't worry about it.

When you get the R-4B up and running, compare them on 10M using the same antenna. NOT at the
same time, obviously..... Don't worry so much about the S-Meter readings, just how a 'real' signal sounds on one or the other. S-Meters are far from calibrated devices.

As for the Wattmeters, a man with two watches never really knows what time it is!!! :-)

The brass tube is the coupling. It has a flat piece of spring steel inside (don't lose it, it's
loose in there) that makes the 'flat' for the shaft.

The PC board IS rather fragile. I grasp the shaft on either side of the coupling, then press my
thumbs together to exert pressure. Much safer than yanking on it! Another method is to use a
screwdriver to pry against the switch frame. All you have to do is get it started. It's been
in that position for 50 years, so it's a little cranky to start.

You're getting close..... You want to get it as close as you can to the 0.07A mark, if not
for you, for the next guy!

As discussed, the meters are not precision devices. They are fairly linear, but not perfect.

A 2.2 ohm resistor is pushing it with a 500 mA full scale meter. The meter internal resistances
vary, as does the full scale current, but they are nominally 3 mA and 430 ohms. 500 mA would be
1.29 V with NO R38. It should take only a couple of ohms at R38 to read correctly. R36 should
really be 3.3 ohms, giving you a full scale of 1.65 V, and R38 at 120 ohms. 0.07/0.5 = 0.14 x
1.65 = 0.231 V for the 70 mA mark.

If you really want to know, measure the voltage across R26 when loaded and calculate the current
based on your 2.2 ohm resistor, then compare with the PLATE meter reading..

Typical 'real' efficiency is about 50-55%.

>
> My meter is a 500 mA max meter and the resistor was 3.3 ohms (as best as I can tell ;)). So I'm shooting for 230 mA drop and I hope my calibration resistor will get it to "look" like 70 mA on the meter. Today on my dummy load with 100 watts out on 80 I measured 220 mA on the meter; this is 143 watts input or 70% efficiency. This is a bit higher than I would expect (I think the meter is reading LOW), but I think it is more important to get the 70 mA accurate on the meter.
>
> If I stick with the 220 ohm resistor as the calibrator the 70 mA is at the 0.08 A setting on the dial. NOW all the currents are a bit high, and with 100 watts out is reads more like 240 mA or 155 watts input (about 64% efficiency). This is closer to "accurate"; maybe I

will just stick with this?

Ah hah! I've even seen this on the list several times, re: the R-4 I
believe. I didn't put two and two together that the 2-B might be the
same coupling.

> The PC board IS rather fragile. I grasp the shaft on either side of

I don't see any way to grip the shaft on either side of the tubing, it
covers the entire length from the switch. I can get a screwdriver in
there to pry between the switch and the tubing, though -- there's even
a break in some sort of collar on the shaft underneath where I can
slip the blade in, I think.

This sounds like a job for the beginning of a troubleshooting session,
though, not the end, so I'm not going to tackle it tonight!

Garey and Steve,
After I sent the last email on my 10 meter measurements I was putting the case on it and wrapping things up. Thats when I noticed the slide switch was in rcvr position. I took a break and came back and installed a switch lock on that thing. I realigned it and things are much better now. I still only get about S7 on the low end of the band with the calibrator but the generator drive for S9 is way different.
@ 28.5 it took -67 dBm and .096 mV
@ 29.00 it took -70 dBm and .068 mV
@ 29.6 it took -70 dBm and .068 mV

Garey I dont know what the mV is except the voltage measurement for the dBm in the setup for my machine. I use dBm unless instructed to use the voltage settings. It does have uV at a lot lower level. Based on what I have taught myself I believe a -70 dBm level for S9 is good. Like I said before, Im a Millwright, give me a rock and a railroad spike and I can make things happen. This radio thing is a hobby and I am basically self taught. So I like to say that I know just enough to be dangerous. The school of hard knocks has bit me more than once.

David -

I'm going to assume you mean 65.3 'micro' (u)volts and not 'milli' (m)volts.

The 'typical' should be ~ 50 uV for and S-9. That is not a 'proof' test. The real proof test
is, 'do you get a noise peak when you adjust the RF TUNE with no antenna?' 'Does the noise level increase when you connect an antenna?' If either or both of these is true, button it up.
You have all the sensitivity you can use. There are many things that can affect this type of
test, and I wouldn't worry about it.

When you get the R-4B up and running, compare them on 10M using the same antenna. NOT at the
same time, obviously..... Don't worry so much about the S-Meter readings, just how a 'real' signal sounds on one or the other. S-Meters are far from calibrated devices.

As for the Wattmeters, a man with two watches never really knows what time it is!!! :-)

David - KX7C

If these are MILI-volt measurements move the decimal
over three places to the right for MICRO-volts. Now, this is
what the signal generator reads but what it actually at the
antenna terminals depends on the impedance of the generator
and receiver and wether the generator output is calibrated
with the assumption that its working into a matched load.
You will have to do some research on the generator to know
whether the output calibration is meaningful.
The S-meter on the TR-4 and R4XB is calibrated to read
S-9 from about 30 micro-volts. This is not exact but both
of mine are pretty close. Note that there is no standard
for the value of S units in db or in microvolts. A sort of
defactor standard is S-9 equals 50 micro-volts and each S
unit equals 6db but different manufacturers have used values
from about 25uV to 100uV for S-9 and S units of anywhere
from about 4db to 6db. In any case check the calibration

of the generator because the values you have are a little high according to the Drake book. I think this is likely a mesurement error and not low sensitivity.
The sensitivity of the TR-4 is speced at 0.5 microvolts for a 10db signal plus noise to noise ratio. This is excellent for a receiver with about a 3 khz bandwidth.
I have never measured the input impedance of my TR-4 but have mesured the R4XB and found it very close to 50 ohms when the preselector is peaked at the measurement frequency. The TR-4 is likely the same.
While the method of measuring signal to noise is pretty straight forward knowing what the voltage at the antenna terminals is with any accuracy is not so simple because you have to know other things. The fact that you get pretty consistent readings over a wide frequency range is a good sign. I will copy Garrey, if the noise goes up when you connect the antenna and you can peak it with the preselector you are doing fine. The receiver in the TR-4 is, btw, a very good one.

20380. Thankyou! Another Drake "On Air"

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-25 08:44:40 UTC
From: Steve VK2SJA
Topic: 20370 Message: 20380

Hi Guys,

A very quick thank-you to everyone on this list. Who over the last four months patiently answered my dumb questions and supported me every step of the way.

I can now report that the Drake TR-4C at radio station VK2SJA was finally put to air this afternoon after one last round of alignments. The test was only across town on a prearranged schedule using low power with someone I can trust to give accurate on-air reports. Both RX and TX signal quality are excellent. The radio is making very good power now on all bands.

And with no brand bias or exaggeration I would go so far as to say that the receiver is shaping up as something very special indeed. I can honestly say that its the nicest thing I've ever listened to (but maybe that's because I can't afford $10K radios?)

So thanks again everyone. Of course a *very* special thank-you must go to Garey. Without his encyclopedic knowledge of all things Drake and most importantly his most excellent TR-4C Service Guide this would not have been possible.

Gents if you are working on an older Drake you simple *must* get Garey's service guides. Simply indispensable. Cheap too!

I'll report back again after I've made a few contacts.

73, Steve
VK2SJA

PS. Garey, I fixed to S-Meter downward swing/sticking problem on warm-up by throwing in a 1N4148 between R187 and the meter itself. Nothing bad has happened (so far) and it seems to work a treat. R187 had to be re-adjusted for S9+60dB FSD. No doubt to compensate for the diode voltage drop. The S-Meter Zero adjustment on the side of the radio takes a little getting use to now. As you can no longer adjust above and below the zero point. You have to start high and drop down finding the spot at which you hit (nearly) zero and then go no further. But once you get used to it, it's no big deal. I guess the non-linearity of the diode may have messed up the S-Meter calibration. To be honest I should have checked this before I made the mod but didn't. I checked it only after with a step-attenuator and an Elecraft signal generator that provides S9 50uV. The meter reads high for S9 (that should keep them happy ;-), 6dB steps drop by a sensible 1 S-point for most of the scale. In short... Meh! It's not overly accurate. But I've not seen an S-Meter that was. So I judge no worse than most other S-meters I've played with. And it doesn't stick!! So unless you tell me that this mod will cause havoc with AGC/AVC or some such I'm inclined to

leave it as is.

Oh, almost forgot. V17, I can't tell you if it's a 6AQ5 or a 6AQ5A. All the markings seem to have been "cleaned" off this tube. At least there are none visible that I can see (not my doing this time). The only replacement I have is actually a GE 6005??? Not being sure of the substitution and since the radio is working I left it alone.

You're correct of course. My going from memory has gotten me into more trouble.... :-) I was
thinking of the R-4 series, where there IS room to grab the shaft of the control. A thin blade
inserted between the switch bushing (I was 'partially' right!) to pry against. As I said, you
just have to break loose the corrosion that has built up, after which it will pull off
relatively easily.

David -

OK. Just terminology, but it DO make a difference! :-) The first key is that we are discussing 'ratios' relative to one milliwatt, the 'm' in dBm.

-70 dBm is 70 dB below one (1) milliwatt (mW) into 50 ohms. It is equivalent to 71 microvolts
(uV) across 50 ohms, and 0.1 nanowatts (nW) into 50 ohms.

Our 'reference' is 50 uV, which is -73 dBm, so you are certainly 'in the ballpark', and well
within the accuracy of the S-Meter circuitry.

I have a lot of respect for machinists. We had precision machinists (the other end of THAT spectrum) at NRAO who routinely produced pieces to tolerances of less than 0.0005".

Topic: 20317 Message: 20384

What is in there now is the 3.3 ohm shunt (the original one, reads 3.3) and R38 is 220 ohms. Depending on how I tilt my head, and how long the TX is turned on, the "70 mA" reading is just a tad BELOW the 0.08 mark. But I KNOW this is 70 mA. This is good enough for me, if I re-adjust the bias on the AC4 i just have to remember to shoot for JUST below the 0.08 mark.

Thanks.

Paul -

OK. Sounds good. If you haven't put it together yet, I'd like to know the voltage you measure
across the meter itself, and the meter + R38 together. I know the meters varied considerably
(by modern standards) and I'm curious what yours is reading. Preferably at 0.07A and at whatever your fully loaded current is.

One of the (many) faults of engineers is we like to have the numbers come out 'right'! :-)

If it's already back together, never mind. I'll just try an remember for my next opportunity.

Here's a stupid question, the meter in my T-4XC has a little longer hash mark at 70ma. Does the T-4XB have the hash mark on its plate meter?

73,

Doug - N9XTC

Depending on how I tilt my head, and how long the TX is turned on, the "70 mA" reading is just a tad BELOW the 0.08 mark. But I KNOW this is 70 mA. This is good enough for me, if I re-adjust the bias on the AC4 i just have to remember to shoot for JUST below the 0.08 mark.

Doug -

The mark 'above' the scale at 70 mA appeared with the 500 mA full scale meter, fairly early in
the T-4XB production. It was carried through to the T-4XC.

Garey,

It's back together now, but I am sure soon enough I'll have it apart and check this. I assume you mean DC voltage from ground to EACH pin of the meter alone or from one end of meter to the other end of R38?

Tonight I am painting my dial hoods/light diffuser. Got my new Lee Filter material today, with nice white diffuser and new Lee filter it looks SWEET!!

Cool! Nothing like nice new dial filters! :-) Did you switch over to #755 bulbs?? You won't ever have to replace them!

Just across the meter, and then across the meter and R38 combined. Should be less than 2 VDC
with 500 mA of current. Just whatever voltage you read at your confirmed 70 mA and then again
loaded to full power, whatever that current might be. Just trying to get a handle on just how
far these meters 'roam' from the nominal specs.

Glad you got it working, just enjoy using it for a while.

Date: 2014-04-26 03:52:08 UTC
From: <rochep@...>
Topic: 20262 Message: 20390

As I mentioned, I replaced this 60 uF electrolytic with a 47 uF I had laying around. I have just started noticing that as I use my rig the VOX delay on CW seems to be changing, getting LONGER to trip back to RX after I am sending. I also noticed (for the first time just now) that the TX seemed to get "stuck" on transmit; even going from CW to TUNE did not "snap" it back to RX and when I fiddled with the VOX DELAY on the back panel it finally went back to RX.

Garey mentioned by using a 47 uF cap I might "upset the VOX for CW". Is this the kind of symptom we are talking about (or is this just a dirty sticky relay that needs cleaning)?

I think Garrey mentioned that specs on old
electrolytics were not very tight. Mostly they were speced
to have some minimum usually around -20% and maybe 80% or
even more maximum. One reason is that the value of
electrolytics changes in use. When they have been stored
without charge for a long time the value tends to go down
but goes back up under charge when the layers re-form.
Modern electrolytics are supposed to be more stable than the
old ones but I think the same thing happens. In any case
47uF is about 80% of 60uF and should not really make a
difference. Of course you can always put a larger one in.
If it worries you do that.
Second note, the setting for both VOX and VOX delay will
be different for CW and phone. Its a bit of a PITA if you
work both to have to re-adjust it but you do. I have also
had problems with the VOX hanging in CW. After adjusting the
delay a couple of times I stopped but I never knew if it was
just the adjustment or working the pot that did it. When set
properly the VOX works smoothly for either phone or CW but
it may take some experimenting to find the ideal settings.
I am sure Drake could have cured a lot of minor problems
(note that no one ever says problem any more, its always
```

issue) by making the box twice the size and three times the price although Collins did both and has even more problems ([pardon, issues).

I'd replace that 47uf cap your right at the fringe of the 60uf tolerance point. Garey pointed out to me that Mauser has 68uf at 250v for around $1.50 for I was having problems finding a 60uf.

OK my T4XB is starting to take shape now :) went from nothing to now almost working :) my current problem may not actually be a problem other then bad tubes but ..... I am going to replace all tubes in the radio anyway for I got it off eBay and don't know the state of the tubes in the radio so I'd rather just get all new good tubes. I'm currently abel to load up the radio on 10m into a dummy load and the max out is 45W then it will drop to 20w then up to 30 then down again is this a sign of bad final tubes or something more?

Thanks all!!

It could be bad finals, but could also be due to a mistuned trimmer or a need for neutralization.

Check both of those first before spending big bucks on new finals. The symptom of output dropping does strongly suggest bad tubes - assuming you have not changed any of the other settings.

Paul -

That idea was kind of an afterthought. One function of C129 is to keep the ~1 kHz audio tone in
V9a from migrating over to V9b via the power bus. This tone is intended to be 'keyed' along with the transmitter by D8 biased as a shunt to ground. Any leakage 'around' D8, (as via the
power bus,) results in a 'backwave', or the audio tone at some reduced level.

Since this same tone when amplified (V10a), rectified (D10), and the resulting DC integrated
(C141), is used to hold the VOX on in CW, any leakage around D8 can accumulate enough to 'keep'
K1 energized.

All that said, 47 uF 'seems' like it should be adequate. Caps of that era were typically spec'd
at +80/-20%, and perhaps Drake was taking advantage of the typical considerably higher than marked capacitance?

If I was working in this one, I'd add another 47 uF cap across the one that's in there and see
if that 'fixes' the problem. The voltage at C141 can tell you what's happening, with at least an
11 M input impedance meter. Tom's (Hayseed) replacement is 60 uF, and has an additional 22 uf
that's not used, I'd add that in parallel with the 60.

Another possible way to improve this situation would be to reduce the value of R94 to 470k or
even 330k to bias C141 and thus V10b a little more negative.

Dave -

You don't mention the output on other bands, but 10M is 'always the first to go' with weak PA
tubes. Assuming alignment and neutralization have been completed, that's most likely.

Alignment tells you a lot. Do the trimmers and slugs peak as they should, i.e., have both an UP
and a DOWN side to the peak.? The trimmers especially on 10M tune near minimum capacitance, resulting in very light tension on the adjustment. Mechanical shock and temperature cycling both affect these adjustments unless they are 'locked' with clear fingernail polish or other
lacquer when alignment is complete. You can move the RF TUNE control a little to require more
capacitance to tighten them up a bit, especially if you don't use the top 10M band segment.

Wild variations in power are more likely a bad resistor or solder joint somewhere. Check the
value and condition of the 15 ohm and 68 ohm resistors in the PA compartment, examine all solder
connections, including the PLATE caps of the PA tubes. Obviously do the screwdriver survey of
all hardware if not already done!

I would strongly advise that you NOT 'replace all the tubes'..... This is never a good idea,
for several reasons. They are NOT sparkplugs that all deteriorate at the rate. Foremost is that
they are getting expensive, and 'they ain't making any more' of most of them. Realizing the fact that even NOS tubes are not always good, replacing them all at once could introduce multiple problems, making each one more difficult to figure out. New tubes should be installed
one at a time and the radio checked out each time one is swapped. If the 'new' tube doesn't appreciably change the operation of the radio, put the old one back in and set the new one aside. Don't be mislead by what might be an alignment change when subbing the RF tubes. When
replacing the PA tubes, turn the BIAS control up to increase the voltage applied and cut the
tubes off. After warm up, reduce the BIAS voltage to get the recommended 70 mA of idle current. Then try to tune up in TUNE position. If ok, check the neutralization immediately. If
you carefully dip the plate at something less than max output, (turn down the GAIN control,)
then watch the output power while you turn the PLATE control slightly one way. If the power decreases ONLY, re-dip carefully and while watching the output turn the PLATE control the other

way. If power decreases only, you're in good shape. If however the power INCREASES even a bit
before dropping off, in either direction, neutralization is not correct and C49 will require
adjustment.

When you've swapped out all the tubes, one at a time, put the 'new' tubes that had no effect on
the radio operation away in a safe place. Then if you have a problem later, you have a reasonable expectation that your 'spare' tube at least won't make things worse, and if it doesn't correct the problem you know the trouble lies elsewhere!

20399. TR-4C Problems on 80 and 40

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-26 15:09:47 UTC
From: <wb6mzs@...>
Topic: 20399 Message: 20399

Hi all,
I have a TR4C that has a problem on 80 and 40. It is deaf, takes about 200 microvolts to make the S meter move and makes only 5 watts out on both bands. All the other bands make full rated output and tune by the book. The receiver is a bit low on sensitivity on 20-10 (about S7 for 50 microvolts) but otherwise OK. The calibrator signal is good on all bands including 80 and 40. So am I still dealing with a bad contact somewhere? This unit was in storage for some time and recently put back in service.

I've cleaned all the switches/contacts, put in fresh set of tubes, and using a rebuilt AC-4 with proper voltages.

Any suggestions and advice will be most welcomed.

Garey Thanks!!!

1) I have the same variation in power at 3.5 I have not tried any other bands at this point.

2) Sorry for the misunderstanding in replacing tubes. I intend to replace them one at a time when I get that far into the project.
3) I checked ALL of the resistors in the PA stage and all are good.
4) neutralization checks ok.
5) no alignment done to the radio at this point. I'm not sure if I should try it now?

Let me recap were I am at this point with the radio.

1) Ebay seller said that one 6JB6 was bad.

2) Received radio and found that coil RFC5 was burnt to crisp and one of the parasitic resistors was disconnect from the coil.

3) wound up another coil and installed it. also was able to get a used working coil but I have not installed it. The original coil shows 2.40oms and my hand wound coil is 2.55oms I think that's good enough no?

4) replaced the two parasitic resistors with new ones. The original ones were over 80ohms each. I presume this might be why the coil went and maybe the tubes?

5) replaced the 60uf and 10uf caps with my temp film caps.

hope this helps

I'm now going to go check YouTube and make sure I'm neutralizing correctly :)

Thanks all!!!!!!! :)

Dave

Well guys, the subject line says it all.

in case you haven't been following the thread about my broken R4A, I'll cut to the chase.

The BFO is not working. I replaced the capacitors, and even the single transistor. No joy.

That leave only one part left in the circuit. The T3 transformer. It looks like an IF can.

So, anyone have a R4A part pig? Or if fate favors the foolish, a new one?

If not, then the R4A i have will be a great AM shortwave receiver. With no BFO, no SSB or CW.

Scrape around the junk box and see if you have one laying in the bottom.

Thanks

Mike, wb8vge

Mike -

If you are to this point, pull the can and open it up. This is a large inductance, probably with a ferrite 'overcoat'. Big inductor means little wire, which has a tendency to break, especially anywhere the wire is nicked. These points are often right at the terminal, which is
visible 'in situ'. The cans are easy to open, remove a turn at the broken end and resolder. Another problem is wire against the ferrite shell, which has sharp edges, wearing off the enamel
coating and shorting to the can. Lastly, when the can was assembled, the 'inside' end of the
terminal was cut off with diagonal cutters, leaving a 'knife' edge sticking up. There is a thin
rubber insulator between the header for the can, and over time that edge cuts through the rubber
shorting the lead to the ferrite.

Aside from this, T11 is the same in both the Late R-4A (s/n 4055 and up) and the R-4B, so you
can widen the search a bit.

Mike -

I would start by carefully examining the fifth BAND switch wafer (from the front panel) on both
sides for corrosion and contact. I suspect you have a dirty switch or sprung contact. Possibly
bad solder. Hopefully 'cleaning all the switches' didn't involve any tools around the wafer
switch contacts, just DeoxIT or other good contact cleaner.

Your 'fresh set of tubes' was a bad idea. These are NOT spark plugs, and NEVER all go bad at
the same time!!!!!!!! See my post earlier today. You have complicated the diagnosis
considerably.

> Hi all,
> I have a TR4C that has a problem on 80 and 40. It is deaf, takes about 200 microvolts to make the S meter move and makes only 5 watts out on both bands. All the other bands make full rated output and tune by the book. The receiver is a bit low on sensitivity on 20-10 (about S7 for 50 microvolts) but otherwise OK. The calibrator signal is good on all bands including 80 and 40. So am I still dealing with a bad contact somewhere? This unit was in storage for some time and recently put back in service.

Dave -

More likely one of the 6JB6s shorted and drew LOTS of current through RFC5 and others, and the
heat generated fried the parasitic suppressor resistors.

Do I understand correctly that the power is jumping on 80M also?? You may have one or more shorted turns in RFC6 causing it to change value intermittently. It's certainly suspect under
the assumption above. RFC5 was just the weakest link!! :-)

DC resistance isn't particularly critical in RFC5, the inductance is the important factor, so
yours should be fine.

I'd also be concerned about the condition of R36 as it's in that same chain that was severely
overloaded.

An intermittent is not going to be affected by alignment, unless one of the trimmers or caps is
shorting intermittently. Not high on the likelihood charts!

I am going to replace all tubes in the radio anyway for I got it off eBay and don't know the state of the tubes in the radio so I'd rather just get all new good tubes. I'm currently abel to load up the radio on 10m into a dummy load and the max out is 45W then it will drop to 20w then up to 30 then down again is this a sign of bad final tubes or something more?

How do you tell what pin is what on T11?

Some pins have continuity, others don't. From the chassis view there is one pin that looks like it has a "1" stamped into the phonelic(?)

There are two windings each one center tapped.

What pins are what ?

Question
If the coil is open on the oscillator side of T11, why do I have voltage to the transistor as it comes from the center tap?

Could be open from the CT to the 'other' end! The mica and ceramic cap in the lower right corner of the board, one end is tied together at the 330 ohm resistor. The other end of these
two caps are tied together and a wire to the transformer.

20413. AC-3 PS For Sale or Swap

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-26 20:12:52 UTC
From: EDEN MCCOLLOUGH
Topic: 20413 Message: 20413

To all,

I have a pretty decent Drake AC-3 power supply that I'd like to sell or swap. It is in very good condition. Serial number 18959. It has been powering my 'B' line quite nicely, but I had a chance to upgrade to a newer AC-4. The AC-3 has an amp keying line wired right in & works nicely. Also it has been recently been re-capped. This supply is excess to my needs now. Make an offer please...either buy or swap something. I will consider all offers. I could really use an MN 2000. I have more pics if wanted. Please email direct off list.

Thanks & 73...
Butch...K3AFR

Garey,
This is likely a DUMB question, but I'll ask it anyway. An R4 s/n 5224 would have to be a late R4A, wouldn't it?? If so, I have the transformer Mike needs on a carcass. I have been outside all day, and hadn't seen his email till now. I got the carcass to help me "surgically transplant" the bandswitch and attached components into my pristine R4 that has the cracked wafer I asked about a long time ago. I'd be glad to help Mike and his friend if it would work.

1) R36 is at 4ohms not the 2.7ohm so that will be replaced.

2) RCF6 is showing around 1.4ohms that's the same residents as RFC2 so I think that's OK no?

Steve-

It's in a can the same size as the other RF/IF cans.... It has a ferrite sleeve over the coil
that fits snugly into the can.

Dave -

OK, should be 3.3 ohms if the PLATE meter is a 0-500 mA scale.

A possible problem with RFC6 is a shorted turn, which kills the inductance of the RFC. A shorted turn can occur when a coil is overheated, and where one turn of wire crosses another
turn and the insulation burns or melts through, shorting one or more turns. This will not show
on an ohmmeter. I only suspect it because that string of components was all subjected to the
high current that caused RFC5 to burn open.

If you don't have one to sub, I'd leave that for a bit and try some of the other possibilities
that may be causing your intermittent.

Please leave the messages intact when replying. I have several projects going at the moment and
it helps me keep them straight if I can look back over what we've discussed.

I have the 0-500 scale. So that's 3.3 ohms 1w at 5% and not the 2.7ohm 1w at 5% resistor?

I see what your saying now a bought the coil. No I don't have a replacement.

I'm looking for that file in the CD for version changes and don't see it off hand

And now for the big question lol ....I think we are fairly confident that the problem stems from a short tube so I'm wondering what you think of the 6146 conversion?

Thanks Garey!!!!

Topic: 20393 Message: 20422

Dave -

Yes, the 500 fs meter should have the 3.3 ohm R36.

I'm referring to the schematic in the MISC directory, 'T-4X 13749" file. R36 is 3.3 ohms in that version. It really depends on the meter. The 400 mA fs meter needs the 2.7 ohm.

I believe the problem 'WAS' a shorted tube that has been replaced AFTER the damage was done. No
suspicion that either of the 'current' tubes is shorted.

Positively not! That's one of those 'internet expert' modifications. There were reasons, (besides cost,) that the 6JB6 was chosen over the 6146. Yes, using the 6JB6s reduced the transmitter cost by <1%, and yes the 6146 is a 'transmitting' tube, but ....

1. The 6146s can't provide the power output of the 6JB6s without increasing the Plate voltage.

2. Increasing the Plate voltage increases costs because higher voltage components have to be
used in several places.

The conversion is a complete rework of the PA cage, the 6146 is 'wider' in an already tight arrangement. The parasitic suppressor, bypass, RFC, input and output networks are for the 6JB6. Aside from the obvious problems this causes, it also makes an entirely new PA from a spurious standpoint. So far as I know, no one has ever done a thorough investigation of parasitic and stability characteristics of the 6146 version.

Finally, the tube cost differential is no longer an issue as they cost about the same... The
6146 'may' be a little more tolerant of overload, because it is incapable of drawing the current
that a 6JB6 is (another one of the reasons for the tube choice). The 6JB6s will last just as
long as the 6146, IF you respect it's capabilities and keep it in resonance. It's kinda like
comparing a GEO and a Corvette. If you aren't careful with the accelerator the Corvette will
put you in the ditch a LOT faster... :-)

Date: 2014-04-27 14:09:15 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 20423

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

OK I will have to order the 3.3 I don't have any on hand. My radio currently has the 2.7 installed hmmmmm...but its measuring around 4ohms.

Found the file :)

" If " RFC6 is good and replacing R36 we should get full power out at this point?

I'm not sure I agree with you with the tubes I think one is bad but we will see lol :)

Thanks for the info on the conversion that I'm NOT doing :)

Thanks Garey

Dave -

You can plug one PA tube in at a time to check them. Plug them into the same socket and connect
the Plate cap. Measure the 15 ohm resistor for that socket with your DMM. IF it is exactly 15
ohms, (not likely,) you should see 0.525 VDC across it, which is 35 mA. If this occurs with ~
-60 VDC on the Grid, the tube is at least serviceable.

If the resistor is actually 16.2 ohms, you should see 0.035 X 16.2 = 0.567 VDC.

OK ... should I have both tubes in the radio and then just swap them measuring the DC voltage on the same resistor or always leave one tube out?

Also I found 6 20ohm resistor to make up the 3.3 and installed it for testing and noticed no change in rf out or readings on the meeter :(

20431. T11 for Mike's R4A

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-27 16:23:49 UTC
From: Don Cunningham
Topic: 20431 Message: 20431

Garey,
I never saw an answer to my "dumb question", so either it got lost, or I just never got your reply. Does an R4 carcass with a serial number of 5224 HAVE to be a late R4A?? In other words, didn't Drake just use consecutive numbers on all the R4(any) receivers?? I bought the carcass I have as just that, a carcass, and don't know which (any) it is. I wanted the bandswitch so I could remove the missing wafer I needed for my mint R4 receiver, but after getting it and seeing how it looks, I may just "graft" the whole bandswitch in there and save myself some headaches. So, I could easily help Mike if he still needs the transformer and the one from this carcass will work.
Thanks,
Don, WB5HAK

Don -

I saw your message, and forgot to reply. :-]

Yes, if it is an R-4(any) chassis with s/n 5224, it IS a Late R-4A. Has 11 tubes, and solid state AVC, BFO and Low Level Audio stages.

I haven't heard back from Mike if he has fully checked his transformer out, there are several
'repairable' failure modes.

We should hear from him again when he finishes his evaluation.

The transmitter should be in TUNE, and the voltage on the 15 ohm resistor should be about 1 volt
on the tube side and about a half volt on the other side. Measure ~ 0.525V across the 15 ohm
resistor.

Start with the BIAS (Grid) voltage at about -60 VDC.

This is what I just did ....

1) with no tubes installed I adjusted the power supply bias until I measured -60vdc

2) installed the two tubes and measures -59.5vdc

3) ran the test with one tube at a time measuring across the 15ohm resistor and got 0vdc on each tube in tune mode

OK, we're doing something wrong.....

Do you have ~650-700 VDC on the Plates of the PA?

Do you have ~260 VDC on the Screens of the PA?

You say you have -60 VDC on the Grids.

You should measure ~ 75-100 VDC on the Cathodes of the PA in SSB. This voltage should drop to
about a volt or so when you switch to TUNE mode with the RF GAIN full CCW.

This is all completely separate from anything else in the transmitter. If at least one of the
tubes is good, the Cathode voltage will go to from ~ 75-100 VDC to ~ 1 VDC. The other end of
the 15 ohm resistor should be about half a volt.

Simple circuit.... Plate of PA tube to Cathode of PA tube, to 15 ohm resistor, to RFC2, to R36,
to ground via relay contacts.

Let me jump in here for a moment. Make sure you are measuring what you think you are. The bias setting is fine. When the function switch is in "Separate" the line to the common of the meter is at ground potential, its grounded at the switch. The high voltage you report at both ends of the cathode resistors suggest that its not the tubes but something else that is keeping the cathode return from ground. From the circuit diagram it could be the choke in the cathode circuit or the switches. The choke can be measured with an ohm meter. I don't know the proper resistance but what you are looking for is an open. Also, its possible there is something amiss with the function switch. I suggest cleaning it very thoroughly even if you have before. See if that makes any difference. You can get some idea of what is going on by having a large schematic printed and tracing out the wiring with colored pencils. The schematic is hard to follow just by eye. You can check the switch with an ohm meter. From the common end of the meter you should be getting a short to ground when the switch is in separate and maybe some other combinations. If its open there will be no cathode return and the tube will not operate.
Poking around with the ohm meter may find other problems such as open solder joints. I think your tubes are probably fine.

Richard -

He's apparently using a phone for messaging and so we lose all previous. A real pain when you've got three or four of these going at a time!! :-)

At one point a while back I had him ground the bottom end of the meter shunt, R36 and he said
the maximum he could get was about 50 mA of idle. He was getting continuity as displayed by the
reduce, intermittent output power. I'm thinking one tube may be bad or weak, which is why I'm
trying to measure them individually. Regardless of the switch or relay, the Cathodes of the PA
will float up to about -80 VDC or so. It's been so long since we started I'm losing track.! :-) He was getting very low output power, jumping 10-20 Watts at random. We started with a 'new' e-Bay special. One parasitic suppressor was fried, along with RFC5 and R36 was at about 4
ohms. My speculation was that a tube probably shorted, and the PO put in 'another' tube to sell
it. The 'jumping' power lead me to suspect RFC6 'may' have a shorted turn, and that RFC5 opened
up in time to keep 6 from frying.

So, back to the future, start with the PA and work forward. The last test was to try and check
the PA tubes, one at a time, to make sure both were sharing the BIAS current. I have seen one
tube go 'bad' to the extent that it will not even conduct IDLE current, so the op is unwittingly
asking one tube to conduct 70 mA at idle.

By the way, the meter common is NOT grounded at the switch in SEPARATE. It's going through a
couple of sets of contacts, but actually just goes through and up to the XMIT CATH line and all
the way around back to the MUTE contact on the relay to reach ground.

Subject: Re: [DrakeRadio] T-4XB low RF out?

This is starting to ring a bell now. I've followed this thread partly at work so see it intermittantly. My thought that the cathode went to ground through the function switch was from tracing it by eye on the computer screen. This is the reason I suggested getting a schematic printed out large and tracing with colored pencils. I find my eye tends to jump plus switches are at best difficult to trace.
I once shorted something, not sure what, while measuring HV. It turned out I had a VOM set on ohms. It blew up the VOM but also blew the filament fuse and the tubes opened up. Very odd beccause the filaments still lit so I suppose some internal lead got fried. In any case the tubes were completely open. That incident made me very careful afteward. I should not admit anything like this in public since I've spent my life working on high end electronics. Once in a while some problem comes up in a mailing list thats like a web bar of soap. You keep thinking you have a grip on it and there it is across the room. One advantage of Drake stuff is that you know it did work once, not like some stuff that was never more than marginal.
Did I mention finding a bad tube in my R4B? Symptom was intermittant hum on CW. I thought it might be modulation hum from a power line at first. Turned out to be a bad 12AX7 in the noise blanker. When the blanker is on the hum is there when its off no hum. Also goes away when the tube is replaced. I was fooled at first because there was no hum when the calibrator is turned on. That's because it evidently turns the blanker off. Anyway, I am off to check storage for another tube. I borrowed one to check if it was the tube. I have never been quite satisfied with the way the blanker works so its possible this tube has been going bad for some time.
Enough rambling.

The web site is right at the bottom of each post:

http://groups.yahoo.com/group/DrakeRadio/

If you did not join the group via the web site you may
have to register there to access the files and archive.
Registering is simple, the instructions are at the site.
The web site has an archive of messages, a files section, a
photo section (one can not send attachments via the list).
The other information you want about the number of members,
etc, is all there. I don't know if the archive has a
general search but its divided up by date and is probably
searchable within a date by the text search in your machine.

Scott,

I used to use an FS-4 with my C-line. Worked fine with no issues. Can't imagine how the FS-4 could load the internal crystals since the FS-4 is functionally removed from the circuit when the crystal switch is on other positions.

Yes

Audio is fine.

S meter will not zero. Goes to S2 on warm up and stays there. No deflection with signals.

Rcvr sensitivity is good.

When I xmit, meter does deflect up very slightly, but not like a normal TR4-C should.

Checked R187 with ohmeter..........seems OK.........

Substituted a known good 6BZ6 in V11..........still the same issue.

20453. 'Pinched' sounding TX audio.....

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-27 23:04:03 UTC
From: EDEN MCCOLLOUGH
Topic: 20453 Message: 20453

Hello to the group.

I have recently acquired a nice B line set of twins....T-4XB, and the R-4B. I have two different mics to use on the set including an Electrovoice 638 Hi Z, and a Shure 444D Hi/Low Z. While trying them both out on 160 meters with my friends who know my voice, all said that both mics really sounded pinched up. Much more of a DX sounding audio than rag chew. Anyone know if that is common with the B line and these particular mics? From all the reviews and articles I've come accross, all seem to think both these mics have nice, smooth and rich audio. I am not getting that. Could there be a problem with the radio? Perhaps this is just how they're supposed to sound, but my friends seem to think they both sound way too narrow. Any ideas would be welcome. Thanks.

73,
Butch...K3AFR

Have you tried both upper and lower SSB on TX? If the mics are In good order the alignment or filter may be at issue.

The data sheets for both mics are on the web. The EV
mic does not show a response curve but the specs are that
its good from 70hz to 10Khz with no note about rising
response. However, it is made for paging, PA, and
communications use so may emphasize the intelligence range
of speech. The 444 has a strongly rising response with a
high peak at about 3000hz. This is very similar to the
Astatic D-104 so it may sound "tinny". Its important that
the carrier oscillator be centered correctly or one sideband
will be shrill and the other bassy. There is a procedure in

the handbook. If you have to adjust it you will probably have to adjust the carrier null, also not a difficult adjustment.
Like many other filter type SSB transmitters the T4XB has somewhat limited frequency response centered in the range that carries the intelligence of speech. However, it should not be pinched or tinny sounding, in fact, with a decent microphone it has very good audio.
I have several microphones, after some testing I get the best reports from an Electro-Voice 664. I've also tried with a couple of very flat studio type mics, the reports are that the 664 is better.
If you have a receiver with fairly wide bandwidth try listening to your own signal over a pair of good quality headphones. A scrap of wire for the antenna will do. But, you can do well with the R4B by taking it off mute, there is enough leakage to produce a good strong signal. Use the widest IF bandwidth to judge quality since the SSB bandwidth is narrow enough to have its own limitations.

Update.... after checking the voltages below I inserted the tubes and warmed up the radio and now I'm getting .1vdc across the 15ohm resistor in ssb tune mode. Maybe I did not let the radio warm up before I don't know. In idle I have 147vdc at the junction of the coil and the 15ohm resistor and in tune now shows .1vdc across the resistor.

OK with tubes out measuring at the sockets I have ....
+650vdc
at P1 and P2 clips +697vdc

You should be able to adjust the IDLE current (0.1V across 15 ohms) to see 0.525 VDC, using the
BIAS control on the AC-4.

ONE PA tube at a time. TUNE mode, RF GAIN at full CCW. You should be able to adjust the BIAS
in the AC-4 for 0.525 VDC across the 15 ohm resistor in the Cathode circuit of the socket with
the tube in it.

Hanging on just a minute here please, the filaments are in SERIES so both have to be in to light. I looked at both versions of the schematic in Garey's disk, both are the same. Since there has been some discussion of the TR-4, which has parallel filaments, perhaps there was some confusion. In any case, you can not check the cathode current with a single tube in place. To check current first measure the cathode resistors carefully. They really should be replaced with modern metal oxide film resistors. This are available in 5% types and will not drift with time or heat. Once you know the resistance you can calculate the current from the voltage drop across each resistor. The circuit is designed for a quiescent (no signal) current of 35 ma per tube or 70 ma total. You are measuring one tube at a time. The voltage across the 15 ohm resistor should be 0.525 volts. The two tubes should be reasonably close. I am not sure of the tollerance on match of the tubes but probably +/- 10% is acceptable. If the tubes are much different one or both should be replaced. The grid bias should be set to obtain the correct voltage drop across the resistors. This is important because the circuit is designed to have minimum distortion at this value of bias.
Panel meter: the panel meter is an indicator not a precision instrument. It is adjusted to read correctly by choice of the surrounding resistors. These are R-36, the meter shunt, and R-38, a series resistor chosen to make the meter read correctly. The value of R-36 depends on the version of the meter used in the set and is either 2.7 ohms or 3.3 ohms. The other resistor is adjusted after obtaining a reference by setting the total cathode current by means of measuring it at the cathode resistors and adjusting the bias to obtain the correct value. Set the cathode current for 35ma per tube. The total will then be 70 ma, the correct resting value. The meter trim resistor is then adjusted to get the meter to read exactly on the 70 ma mark. This is the most important setting meter is used for, other readings are

relative but the meter _must_ be accurate at this one value.
The resistors used for the shunt and trimmer should be
high quality film resistors to prevent drift. The exact
value of the trimmer is not important, only that it makes
the meter read correctly at the 70ma reference mark. More
than one resistor may be used in parallel if necessary to
get the value exactly on. If modern resistors are used at
the cathodes and the meter its unlikely they will ever have
to be changed again.
To set the bias and quiescent current one can use a
couple of techniques. One is to key the transmitter in CW
with the level control all the way counter-clockwise, that
is NO drive. If you have a push-to-talk microphone you can
use that to key the transmitter, again with NO drive, the
level controll completely CCW. Set the bias using the pot
on the back of the power supply. This supply seems to be
pretty stable but you should check the resting current when
firing up the transmitter just each time just to make sure.
The main thing when trying to find problems is to
isolate them. Trying too many things at once is just
confusing. Its always well to start with resistance
measurements and then voltage measurements. I suggested
earlier that a marked up large scale schematic can be very
helpful. Almost any of the big stationary places like
Staples offers this service for very little.
Much of what I am saying here is simply repeating
Garrey's advice but summarizing it.
I have a T4XB on which I had to do a lot of work beause
someone had been into it. After struggling I got Garrey's
disc and discovered quickly that there was a wiring error
that caused an adjustment to be impossible. I also have an
R4B, the two are an outstanding combination. What I need now
is a decent antenna.

20471. new to me TR-7

Yahoo group: DrakeRadio (2014-01 — 2014-05)
Date: 2014-04-28 08:24:54 UTC
From: geoffrey mendelson
Topic: 20471 Message: 20471

Well, it finally arrived.

It's a beat up (some plastic cracked and scratched top) TR-7. It had the bottom replaced with a sheet metal box covered with white contact paper. On the front of the box to the left is a second microphone jack and a toggle switch. The switch reads T on top and TTY on the bottom.

The power cord was soldered in place by soldering wires to the pins.

It has a calibrator, but does not seem to have a noise blanker. The only filter position filled is A.

It makes noise like it receives and changes if I put a wire in the antenna socket.

Now the bad news. It only displays every other band, for example when set to 14mHz, it displays 14mHz frequencies, when the band switch is moved to 7 it the display does not change. Similar with 3.5 mHz.

The really bad news is that the PTO knob is frozen. The knob was missing the setscrew and you can see where someone tried to tune it with a pair of pliers. I did too, but not hard enough to scratch the metal, which someone else did. There is nothing between the knob and the dial skirt, and inside is just a rotted rubber tube and a metal disk. If you remove them the brass tube which allows you to calibrate the dial moves and the frequency changes.

I have not tried to transmit yet.

What's really weird is that serial number is blacked out, but a previous owner inscribed his Israeli ID number.

My goal is to use it for a general purpose SW receiver and a ham band transceiver.

Geoff.

1. if the PTO is beyond easy repair, can I just plug in an R-75 VFO and use it instead?

2. The radio has a 120 volt fan. So far I have been powering it off of 12v from wires soldered to the power plug. If remove the wires, and connect it to a PS-75 set for 230 volts, will the fan burn out?

Thanks in advance.

Geoff.

use it instead?
Don't know why it wouldn't.

2. So far I have been powering it off of 12v from wires soldered to the
power plug.
Shades of mobile installation. In any case left that way I would have two
positive leads, that way when you transmit the finals won't pull down the
rest. EG transmit = dimming lights.

The radio has a 120 volt fan. If I remove the wires, and connect it to a
PS-75 set for 230 volts, will the fan burn out?
Would have to check the schematics etc, off the top of my head I would say
no as its the primarys of the power supply at 230..
However the fan would be when you were doing RTTY more than anything in
any case. I run them just to stabilize the rig quicker.
I question is the PS 75 which I think is a bit light for a TR7, the normal
is a PS 7.

My opinions only. Carl WD8NHK

It is wired across both pins on each side. I was told it did not have a
power cord, so I mail ordered a really well made one from the US via
eBay. I'd rather use that than have the bare metal exposed, but for now
I just want to see it work.

The PS-75 is because I have one. :-)

I only plan to run it at about 20 watts SSB anyway.

Thank you and 73,

Geoff.

Hello Geoffrey,

1. Sure, the RV-7 or RV-75 will work without a problem. However, I would try to repair the PTO. There is no special magic in it. See the service manual about the procedure to get it out. You have to remove the DR-7 and the band switch and tilt the front panel.
